## Problem Set-3

Special probability mass functions and density functions, covariance and correlation
Date:08/09/2017

1. What is the probability of getting at least one 6 in throwing of a dice 10 times?
2. Toss a fair coin $M$ times. (a) Move one step forward (in one particular direction) each time you get a head (H). What is the probability $P(n)$ that you are n steps away from where you have started?
(b) If you move one step forward for each H and one step backward for each tail (T), what is $P(n)$ ? What is the mean and variance of the probability mass function (PMF)? Find the mode of PF for $M=3$ ?
3. Let $X$ be a Binomial random variable with parameters $n$, and $p$. Show that

$$
P(X=x+1)=\frac{p}{1-p}\left(\frac{n-x}{x+1}\right) P(X=x)
$$

4. In a 10 -over cricket match, the runs that can be scored by a poor batsman is given by a Poisson distribution with parameter $\lambda=10$. On the other hand, the runs that a good batsman can score is given by a Poisson distribution with parameter $\lambda=30$. If a batsman scores 20 runs in the match, would you judge him as good or poor?
5. Let $X$ be a Poisson random variable with parameter $\lambda>0$. then show that $E\left(2^{X}\right)=\frac{1}{P(X=0)}$
6. An investigator notices that children develop chronic bronchitis in the first year of life in about 3 out of 20 households where both parents are chronic bronchitis, as compared to the national incidence rate of chronic bronchitis, which is $5 \%$ in the first year of life. How likely are infants in at least 3 out of 20 households will develop chronic bronchitis if probability of developing the disease in any one household is .05 ?
7. A probability class has 300 students and each student has probability $1 / 3$ of getting an $A$, independently of any other student. What is the mean of $X$, the number of students that get an A?
8. If $X$ is a normal random variable with mean $\mu$ and variance $\sigma^{2}$, and if $a, b$ are scalars, then show that the random variable

$$
Y=a X+b
$$

is also normal with mean $a \mu+b$ and variance $a^{2} \sigma^{2}$.
9. What is the probability that a $z$ picked at random from the population of $z$ 's will have a value between -2.5 and 2.5?
10. Two continuous random variables $X$ and $Y$ have a joint probability distribution function

$$
f(x, y)=A(x+y)
$$

where $A$ is a constant and $0 \leq x \leq 1 ; 0 \leq y \leq 1$.
(a) Determine $A$.
(b) Calculate the correlation $(\operatorname{Cov}(X, Y))$ between $X$ and $Y$.
11. Roll a dice $(n=1,2, \ldots 6)$. Two events $s_{1}$ and $s_{2}$ are defined as follows:

$$
\begin{aligned}
& s_{1}= \begin{cases}1 & \text { if } n=2,4,6 \\
-1 & \text { if } n=1,3,5\end{cases} \\
& s_{2}= \begin{cases}1 & \text { if } n=3,6 \\
-1 & \text { if } n=1,2,4,5\end{cases}
\end{aligned}
$$

Show that $<s_{1} s_{2}>=<s_{1}><s_{2}>$. Show that $P\left(s_{1}, s_{2}\right)=P_{1}\left(s_{1}\right) P_{2}\left(s_{2}\right)$. So $s_{1}$ and $s_{2}$ are uncorrelated.
12. Repeat 1 with the following $s_{1}$ and $s_{2}$ to show that the events are correlated. Find $\operatorname{Cov}\left(s_{1}, s_{2}\right)$ and correlation coefficient.

$$
\begin{aligned}
& s_{1}= \begin{cases}1 & \text { if } n=1,2,3 \\
-1 & \text { if } n=4,5,6\end{cases} \\
& s_{2}= \begin{cases}1 & \text { if } n=2,4,6 \\
-1 & \text { if } n=1,3,5\end{cases}
\end{aligned}
$$

Table of Standard Normal Cumulative Probabilities

| $z$ | -3.0 |  |  |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\Phi(z)$ | 0.001 |  |  |  |  |  |  |  |  |  |
| $z$ | -2.9 | -2.8 | -2.7 | -2.6 | -2.5 | -2.4 | -2.3 | -2.2 | -2.1 | -2.0 |
