

HyperLedger Fabric

Hyperledger

“Hyperledger is an open sourced community of communities to benefit an ecosystem of Hyperledger based solution providers and users focused on blockchain related use cases that will work across a variety of industrial sectors.” –

Brian Behlendorf

(Executive Director, Hyperledger)

Hyper... What?

In simpler terms, Hyperledger can be thought of as a software which everyone can use to create one's own personalised blockchain service.

Restrictions

“Public blockchains requires each peer to execute each and every transaction and run ‘consensus’ at the same time” are....

Not Scalable

Do not support Private and Confidential transactions

Friend in Need

Suppose Bob, had a friend in Switzerland,
and they had a special deal as they were old friends!

I need to buy swiss
chocolates!

Bob

40% off just for
you!!

Alice

But Alice has a Big Market

Private and Confidential

On a Public Blockchain

Every ledger will be updated about Alice and Bob's special deal

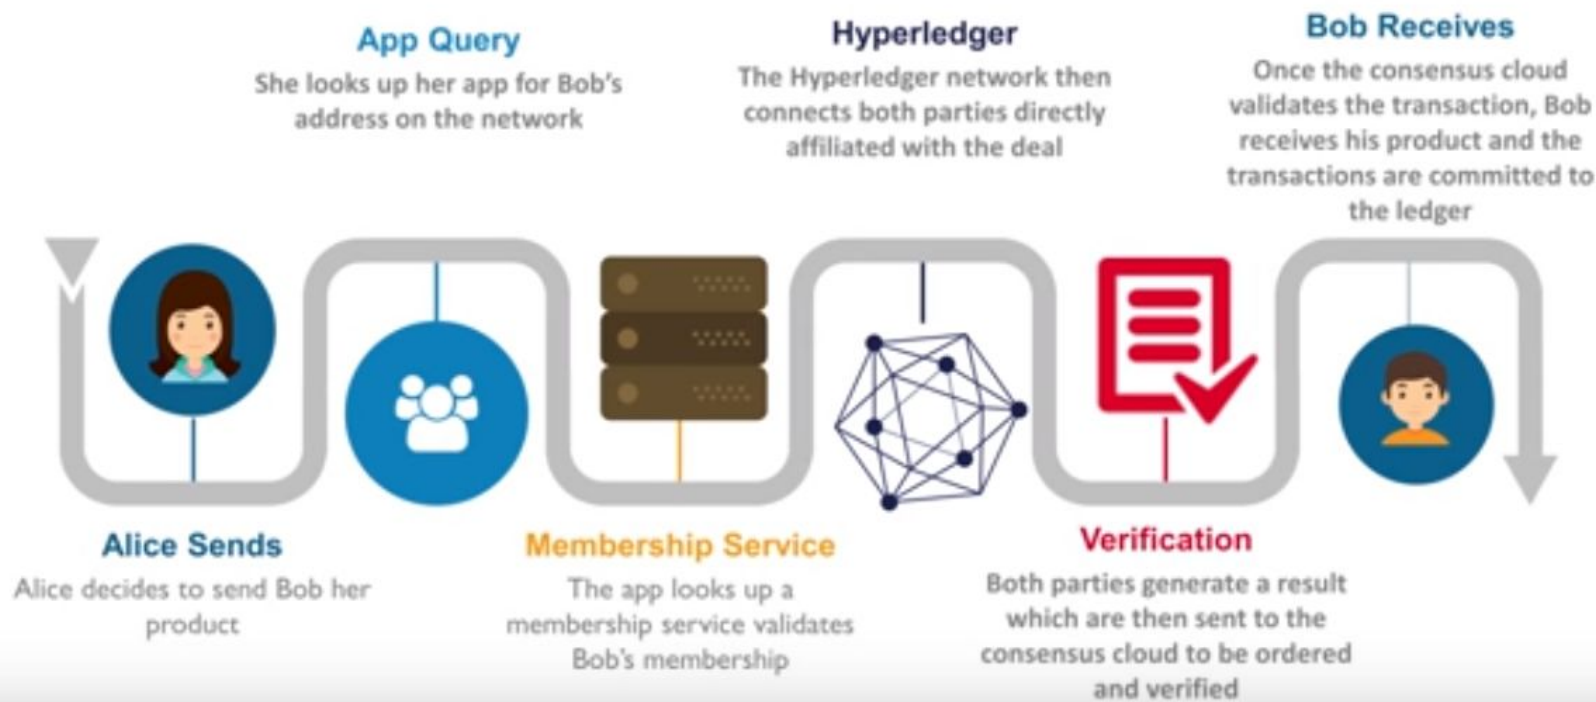

The Hyperledger Way

On the Hyperledger network, only parties directly affiliated with the deal are updated on the ledger and notified. Thus maintaining privacy and confidentiality

How it works?

Pattern Matching

This same pattern is needed by a lot of industries where confidential obligations are need to be met without passing everything through a central authority.

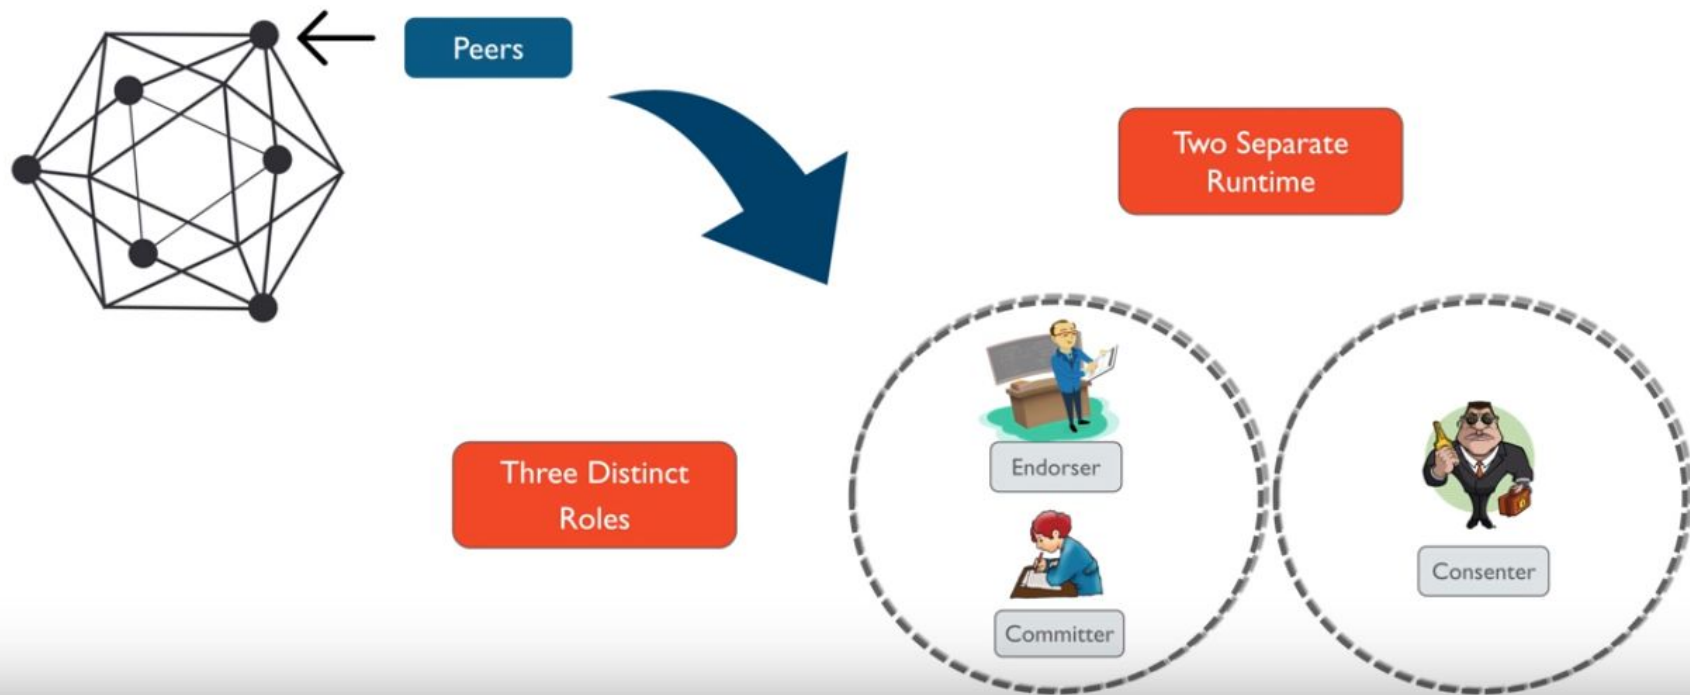

So how is Hyperledger different from
existing blockchain platforms?

It is a private and permissioned Blockchain system which means Unlike, in Permissionless(or public network) systems that allow unknown identities to participate in the network, the members enroll through **Membership Service Provider (MSP)**.

It also offers the ability to create channels, allowing a group of participants to create a separate ledger of transactions.

Notable Changes

Peer Roles: Committer

Committer

Responsible for

1. Append validated transactions to their specific ledger

Peer Roles: Endorser

Endorser

Responsible for

1. Simulating Transactions
2. Preventing unstable and Non deterministic transactions

Peer Roles: Consenter

Consenter

Responsible for

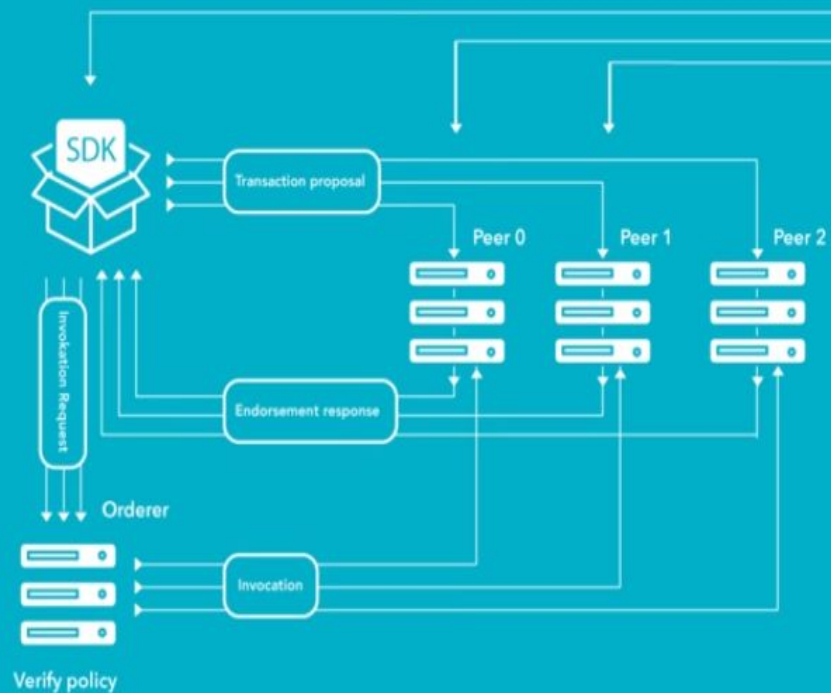

1. Network's Consensus service
2. A collection of consensus service nodes (CSNs) will order transactions into blocks according to the network's chosen ordering implementation

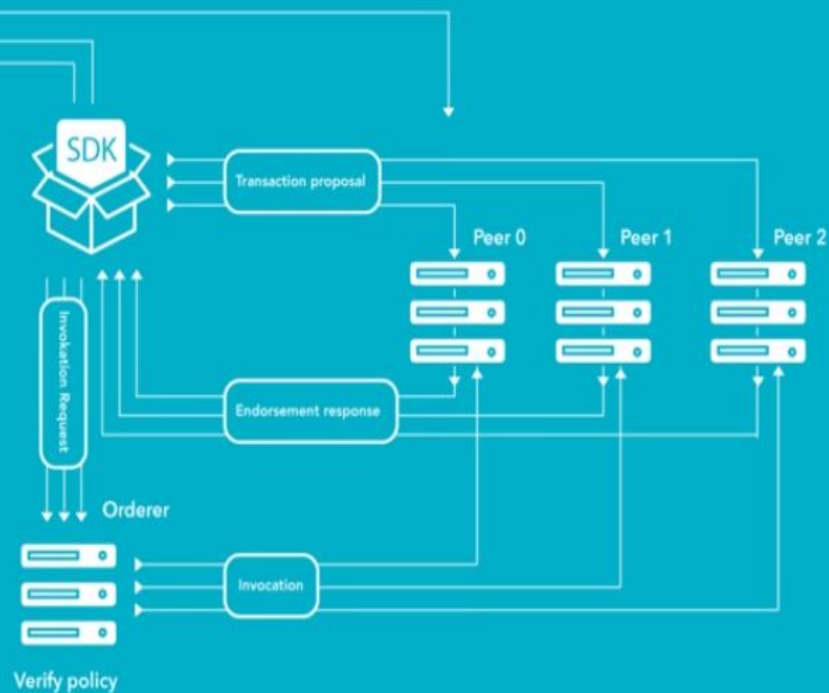

Working of HyperLedger

1 ORGANISATION

2 ORGANISATION

Fabric issues transactions with derived certificates that are unlinkable to the owning participant

Relies on a smart contract system (Chaincode), which every peer of the networks runs in Docker containers

The events are structured as transactions and shared among the different participants

The transactions are executed without a cryptocurrency

All transactions are secured, private, and confidential. Fabric can only be updated by consensus of the peers

All participants must register proof of identity to membership services in order to gain access to the system

The content of each transaction is encrypted to ensure only the intended participants can see the content

Benefits

Data Protection & Consistency

Use permissions to ensure accountability of membership & access rights

Confidential transactions

Use Give businesses the flexibility & security to make transactions visible to select parties with the correct encryption keys

No cryptocurrency

Does not require mining & expensive computations to assure transactions

Programmable

Leverage the embedded logic in smart contracts to automate business process across your network

How Hyperledger Differs

Parameters	Bitcoin	Ethereum	Hyperledger
Cryptocurrency	Bitcoin	Ether	None, but can be implemented when required
Network	Public	Public	Permissioned
Consensus	Proof of Work (SHA256)	Proof of Work (Ethash)	PBFT (practical byzantine fault tolerance)
Smart Contract	None	Yes (Solidity)	Yes (chaincode)
Language	C++	Golang, Python	Golang, Java
