

# Lecture 1 : Introducing Cloud and Edge Computing

**Dr. Bibhas Ghoshal**

**Assistant Professor**

**Department of Information Technology**

**Indian Institute of Information Technology Allahabad**

# Resources

Course website : [https://profile.iiita.ac.in/bibhas.ghoshal/teaching\\_cloud.html](https://profile.iiita.ac.in/bibhas.ghoshal/teaching_cloud.html)

- Slides, Important links, research articles, homework and lab assignments will be provided here

## Recommended Books

### 1. **Distributed and Cloud Computing : From Parallel processing to Internet of Things**

*Kai Hwang, Jack Dongarra, Geoffrey.C.Fox*

Morgan Kauffman, 2011

### 2. **Cloud Computing : Principles and Paradigms**

Edited by *Raj Kumar Buyya, James Broberg, Andrzej Goscinski*

*Wiley, 2011*

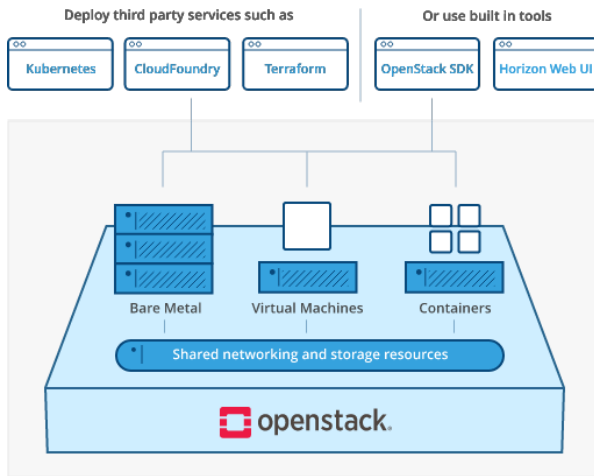

### 3. Research Papers

(will be provided on the course website time to time)

- Slides provide key concepts, books provide details
- Use lecture notes supplemented with textbook and internet

# Resources for Tut and Lab

# CloudLab

## Software Environments

## Web Services and languages

# What is the course all about ???

- **Cloud Computing Technology**

- Cloud computing basics – overview, architecture, deployment
- Virtualization
- How to use cloud tools, APIs, SDKs
- How to access cloud – cloud simulator

- **Cloud Computing as Distributed Systems Environment**

- How to design Applications for cloud
- Web services, Service oriented architecture
- XML, SOAP, WSDL and REST
- Managing Data, Economics
- Open Stack
- Map Reduce
- Case study with commercial clouds - Microsoft Azure and Google Cloud Platform

- **Cloud Computing as a Research Topic**

- Cloud Security, Federated
- Fog Computing
- DOCKER Container
- Cloud Computing Challenges

- **Edge Computing**

- Edge Computing Basics – Architectures, Applications, Edge Intelligence
- IoT Cloud
- Mobile Computing

# What is a computer ?

## Computer

From Wikipedia, the free encyclopedia

*For other uses, see [Computer \(disambiguation\)](#).*

A **computer** is a **machine** that can be programmed to carry out **sequences** of **arithmetic** or **logical operations** automatically. Modern computers can perform generic sets of operations known as **programs**. These programs enable computers to perform a wide range of tasks. A **computer system** is a "complete" computer that includes the **hardware**, **operating system** (main **software**), and **peripheral** equipment needed and used for "full" operation. This term may also refer to a group of computers that are linked and function together, such as a **computer network** or **computer cluster**.

A broad range of **industrial** and **consumer products** use computers as **control systems**. Simple special-purpose devices like **microwave ovens** and **remote controls** are included, as are factory devices like **industrial robots** and **computer-aided design**, as well as general-purpose devices like **personal computers** and **mobile devices** like **smartphones**. Computers power the **Internet**, which links hundreds of millions of other computers and users.

Early computers were only meant to be used for calculations. Simple manual instruments like the **abacus** have aided people in doing calculations since ancient times. Early in the **Industrial Revolution**, some mechanical devices were built to automate long tedious tasks, such as guiding patterns for **looms**. More sophisticated electrical **machines** did specialized **analog** calculations in the early 20th century. The first **digital** electronic calculating machines were developed during **World War II**. The first **semiconductor transistors** in the late 1940s were followed by the **silicon**-based **MOSFET** (MOS transistor) and **monolithic integrated circuit** (IC) chip technologies in the late 1950s, leading to the **microprocessor** and the **microcomputer revolution** in the 1970s. The speed, power and versatility of computers have been increasing dramatically ever since then, with **transistor counts** increasing at a rapid pace (as predicted by **Moore's law**), leading to the **Digital Revolution** during the late 20th to early 21st centuries.

Conventionally, a modern computer consists of at least one **processing element**, typically a **central processing unit** (CPU) in the form of a **microprocessor**, along with some type of **computer memory**, typically **semiconductor memory** chips. The processing element carries out arithmetic and logical operations, and a sequencing and control unit can change the order of operations in response to stored **information**. **Peripheral** devices include input devices (keyboards, mice, **joystick**, etc.), output devices (monitor screens, **printers**, etc.), and input/output devices that perform both functions (e.g., the 2000s-era **touchscreen**). Peripheral devices allow information to be retrieved from an external source and they enable the result of operations to be saved and retrieved.

Computers and computing devices from different eras – clockwise from top left:  
Early vacuum tube computer (**ENIAC**)  
Mainframe computer (**IBM System 360**)  
Desktop computer (**IBM ThinkCentre S50** with monitor)  
Supercomputer (**IBM Summit**)  
Video game console (**Nintendo GameCube**)

# History of Computing

Babbage Difference Engine, 1879

Harvard Mark-I, 1944

MIT Whirlwind, 1951

IBM 360 Mainframe, 1964  
\$2.5-3 million

DEC PDP-8 minicomputer, 1965,  
\$18,000

ATARI micro computers Gaming + home computing, 1979

# Trends in Computing

- 1. Distributed Computing**
- 2. Grid Computing**
- 3. Cluster Computing**
- 4. Utility Computing**
- 5. Cloud Computing**

# Distributed Computing

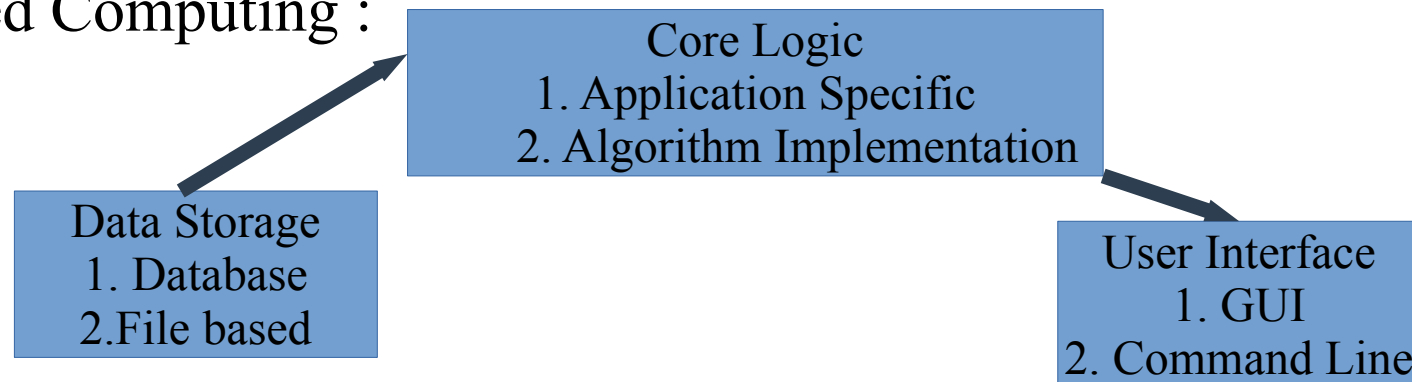

**Distributed Computing is a method in which different parts of a computer program run simultaneously on two or more computers that are communicating with each other over a network.**

## Traditional Computing Components:

All Components sit on the same computer

## Distributed Computing :

# Characteristics of Distributed Computing

- 1. Each node plays a partial role**
- 2. Fault Tolerance**
- 3. Transparency**
- 4. Resource sharing**
- 5. Load Sharing**
- 6. Easy to expand**
- 7. Performance**

# Cluster Computing

Cluster Computing : Type of parallel or distributed computer systems which consists of stand-alone computers working together as a single integrated computing resource

Clusters are deployed to improve speed and/or reliability over that provided by a single computer while typically being much more cost effective than single computer of comparable speed or reliability

## Characteristics :

- i. Network is faster than typical LAN
- ii. Low Latency Communication protocols
- iii. Loosely coupled than Shared Multiprocessors

## Types of Cluster :

- i. High availability or Fail over cluster
- ii. Load Balancing cluster
- iii. Parallel/Distributed Processing cluster

# Big Computers

## Sun E-10000 “supermini”

- i. Up to 64 processors @250MHz
- ii. Up to 64 GB RAM
- iii. Up to 20 TB Disk
- iv. Used by eBay, among others

## PC

200 MHz CPU, 32MB RAM, 4 GB disk

## UC Berkeley Networks Of Workstations (1994-1999)

NOW0,  
1994  
4 HP-735's

NOW1,  
1995  
32 SUN  
Spark  
Stations

NOW2,  
1997  
60 SUN  
Spark-2

# Grid Computing

Grid Computing : combination of computer resources from multiple administrative domains applied to a common task \*

Core idea

- distributed parallel computation
- super virtual computer

## • Electrical Grid Analogy

Electrical Power Grid	Grid
Users get access to electricity through wall sockets with no care of where or how the electricity is generated	Users get access to computing resources ( processor, storage, data applications) as needed with no knowledge of where the resources are located
The power grid links power plants of different kinds	The grid links computing resources and provides mechanism to access them

\* Ian Foster's and Carl Kesselman's seminal work, "The Grid: Blueprint for a new computing infrastructure" (2004)

# Grid Computing

## Characteristics:

1. Share more than information - data, computing power, applications in dynamic environment, multi-institutional and virtual organization
2. Efficient use of resources – People from many institutions work to solve a problem
3. Join local communities
4. Interactions with layer underneath must be transparent

## Need for Grid Computing :

1. Exploiting under utilized resources
2. Data Visualization is important
3. Scientific problems are becoming complex and users need more accurate and precise solutions to their problems in minimum time – need scientific collaboration

## Uses of Grid Computing :

1. Weather forecast
2. Detection and Modelling of natural disasters
3. Physics applications
4. Crystallography

## Type of Grids :

1. Computational Grid
2. Data Grid
3. Collaboration grid

# Data Centre Computing

When computing needs exceed computing resources, there are 2 options (not mutually exclusive)

1. Scale-up (vertical scaling): Increase resources of individual server
2. Scale-out (horizontal scaling): Increase the number of servers

Modern Data Centres lean towards Scale-out

Data Center Architecture

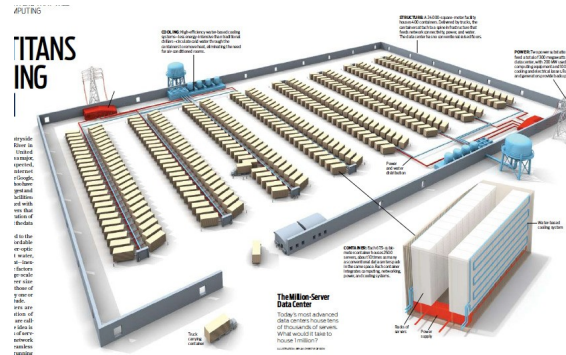

# Data Centre

2005: Datacenter is new “server”

“Program” => Web search, email, map/GIS, ...

“Computer” => 1000's computers, storage, network

Warehouse-sized facilities and workloads

Figures : Sun Microsystems, CNET, & datacenterknowledge.com

# Data Centre as a Computer?

Facebook Datacenter, Clonee, Ireland

Google Datacenter, USc

Inside the Google Datacenter

*Figure Source : Internet*

# Utility Computing Arrives

- Amazon Elastic Compute Cloud (EC2)
- Compute unit rental: \$0.08-0.80/hr.  
1 CU  $\approx$  1.0-1.2 GHz 2007 AMD Opteron/Xeon core

Instances	Platform	Cores	Memory	Disk
Small - \$0.10/hr	32-bit	1	1.7GB	160 GB
Large - \$0.40/hr	64-bit	4	7.5GB	850 GB
XLarge - \$0.80/hr	64-bit	8	15.0GB	1690 GB

Billing rounded to nearest hour; pay-as-you-go storage also available

A new paradigm for deploying services

“Computing as Utility” – A vision from MULTICS c. 1969

# Computing Today

SaaS Computing

The Million Server Datacenter  
Providing IaaS

*Slide Adapted from : Virtualization and Cloud Computing, Sourav Bansal, <http://www.cse.iitd.ernet.in/~sbansal/csl862>*

# What exactly is Cloud Computing?

“ It is Nothing New “

“ ...we’ve redefined Cloud Computing to include everything that we already do... I don’t understand what we would do differently ... other than change the wording of some of our ads.”

– Larry Ellison, CEO, Oracle  
(Wall Street Journal, Sept. 26, 2008)

**Must Read !!!**

# Above the Clouds: A Berkeley View of Cloud Computing

(February 10, 2009)

[abovetheclouds.cs.berkeley.edu](http://abovetheclouds.cs.berkeley.edu)

# Cloud Computing

- Old Idea : Software as a Service (SaaS)  
Software hosted on local servers or desktops (dumb terminals)
- New : pay-as-you go utility computing  
Illusion of infinite resources on demand  
Fine grained billing : release == don't pay; Services – longer commitment, more \$\$\$/hour  
Public vs. Private cloud
- Why Now?
  - i. The Web “[Space Race](#)”: Build-out of extremely large datacenters (10,000's of commodity PCs)
  - ii. Driven by growth in demand (more users) -
    - Infrastructure software : e.g., Google File System
    - Operational expertise
    - Discovered [economy of scale: 5-7x](#) cheaper than provisioning a medium-sized (100's machines) facility
  - iii. More pervasive broadband internet
  - iv. Open source software

# Cloud Computing - NIST

Cloud Computing is a model for enabling convenient, on demand network access to a pool of configurable computing resources ( eg. Network, server, storage, applications, and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction. This cloud model promotes availability and is composed of five essential characteristics, three service models, and four deployment models

<http://csrc.nist.gov/groups/SNS/cloud-computing/cloud-def-v15.doc>

# Cloud Economics

- Static Provisioning for peak – wasteful but necessary

“Statically provisioned”  
data center

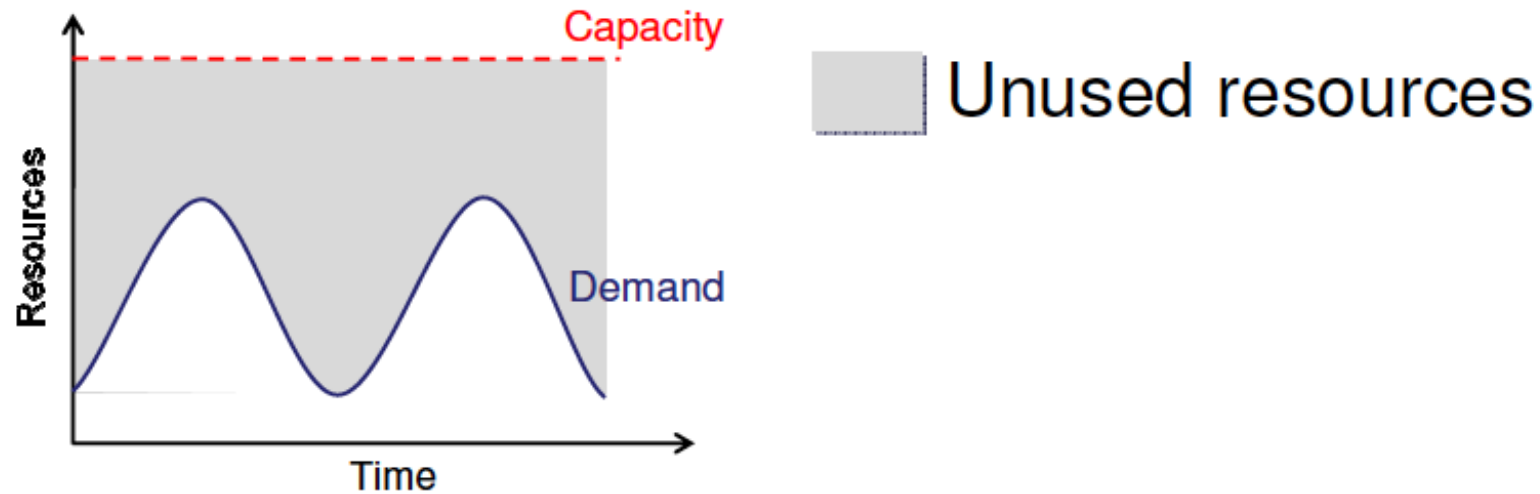

“Virtual” data center  
in the cloud

■ Unused resources

*Slide Adapted from : Above the Clouds: A Berkeley View of Cloud Computing (February 10, 2009)*

# Risk of UnderUtilization

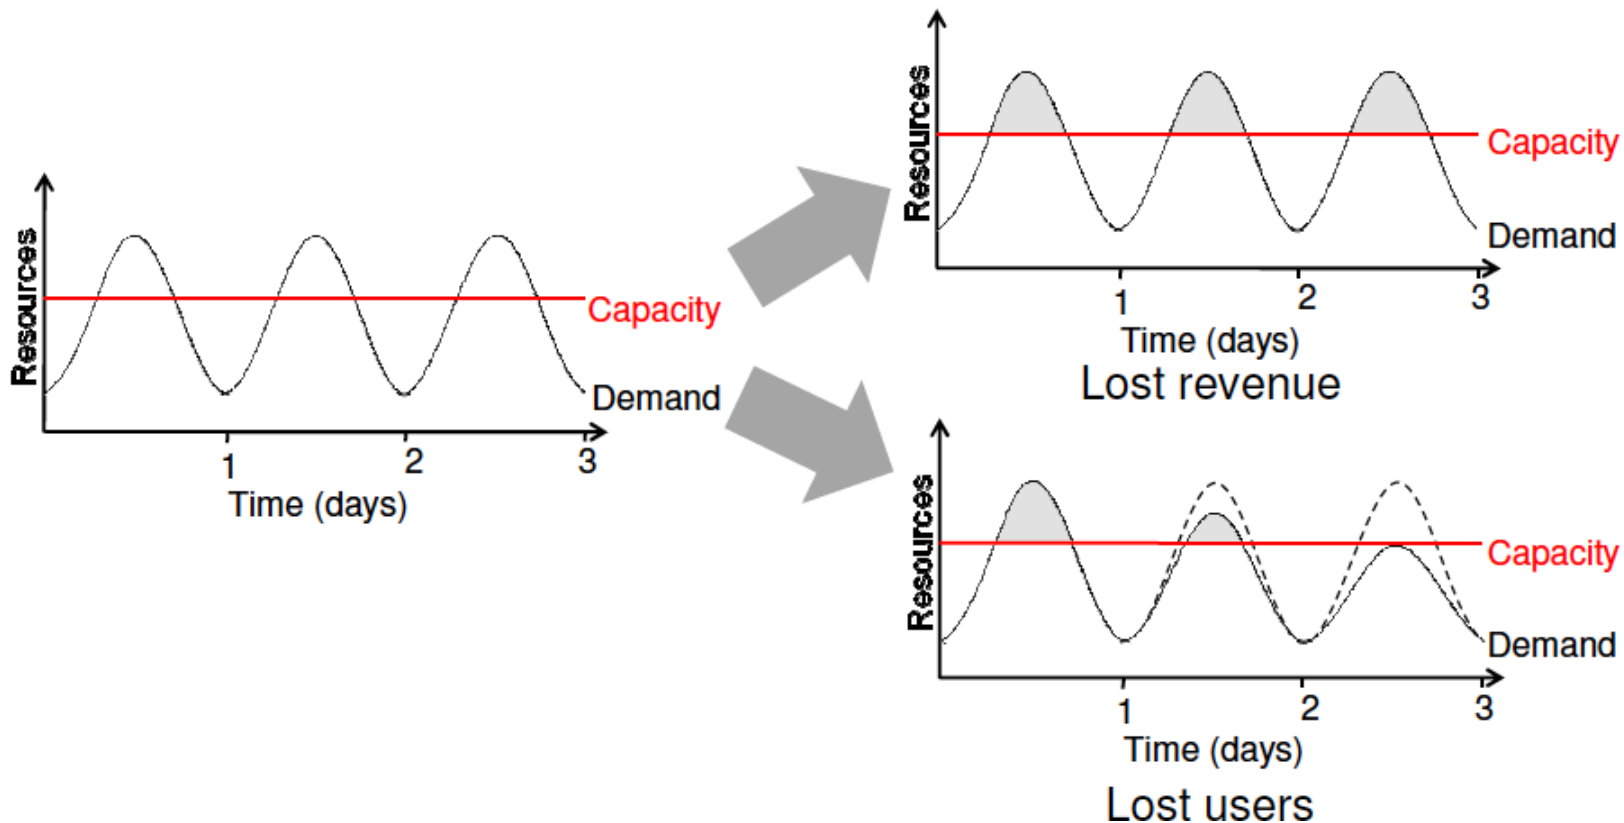

- Underutilization results if peak predictions are too optimistic

Static data center

*Slide Adapted from : Above the Clouds: A Berkeley View of Cloud Computing (February 10, 2009)*

# Risk of Under Provisioning

Slide Adapted from : *Above the Clouds: A Berkeley View of Cloud Computing* (February 10, 2009)

# Cloud Computing Vs. Grid Computing

- **Distinctions not clear because Cloud and grid share similar visions**
  - Reducing computing costs
  - Increasing flexibility and reliability by using third-party operated hardware
- **Resource Sharing**
  - Grid : collaboration
  - Cloud : assigned resources not shared
- **Virtualization**
  - Grid : Virtualization of data and computing resources
  - Cloud : virtualization of hardware and software platforms
- **Security**
  - Grid : security through credential delegation
  - Cloud : security through isolation
- **Self Management**
  - Grid : reconfigurability
  - Cloud : reconfigurability and self healing
- **Payment mode**
  - Grid : rigid
  - Cloud : flexible

# Cloud Computing Characteristics

- **Cost Associativity**
  - 1,000 CPUs for 1 hour same price as 1 CPU for 1,000 hours
- **On-demand self service**
  - Consumer can unilaterally provision computing capabilities without human interaction with service provider
- **Broad network access**
  - Capabilities are available through network and using standard mechanisms
- **Multi-tenancy / Resource pooling**
  - Provider's resources are pooled to serve multiple customers
- **Rapid elasticity**
  - capabilities can be rapidly and elastically provisioned
  - Unlimited virtual resources
  - Predicting a ceiling is difficult
- **Measured service**

# Relevant Technologies in Cloud Computing

- Access
  - heterogenous set of thick and thin clients
  - high speed broad band access
  - Data centres ( large computing capacity )
- Virtualization ( Decoupling from physical computing resources)
  - Types : Hardware , Memory, Storage, Network
  - Hardware : emulation (QEMU) , para-virtualization (Xen), full virtualization (VMware)
  - Memory : Decouples RAM resources from individual systems
    - Aggregates these resources into a virtualized memory pool available to any computer
  - Storage : abstracting logical storage from physical storage
  - Data Virtualization : Data as an abstract system independent of underlying data base systems, data structure
    - And storage
  - Network : Virtualized Network addressing space with or within or across network subnets; VPN

## Q : How do you measure Virtual Resources

**Amazon ECU ( Elastic Compute Unit) : EC2 Compute unit equals 1.0 – 1.2 GHz 2007 Opteron or 2007 Xeon processor**

## • APIs

Required for various operations and applications; No standards

# Cloud Service Taxonomy

- Layer

Hardware – as - a Service (Haas)

Infrastructure -as -a Service (IaaS)

Data Storage – as- a- Service (DaaS)

Communication-as-a Service (CaaS)

Platform-as-a Service (PaaS)

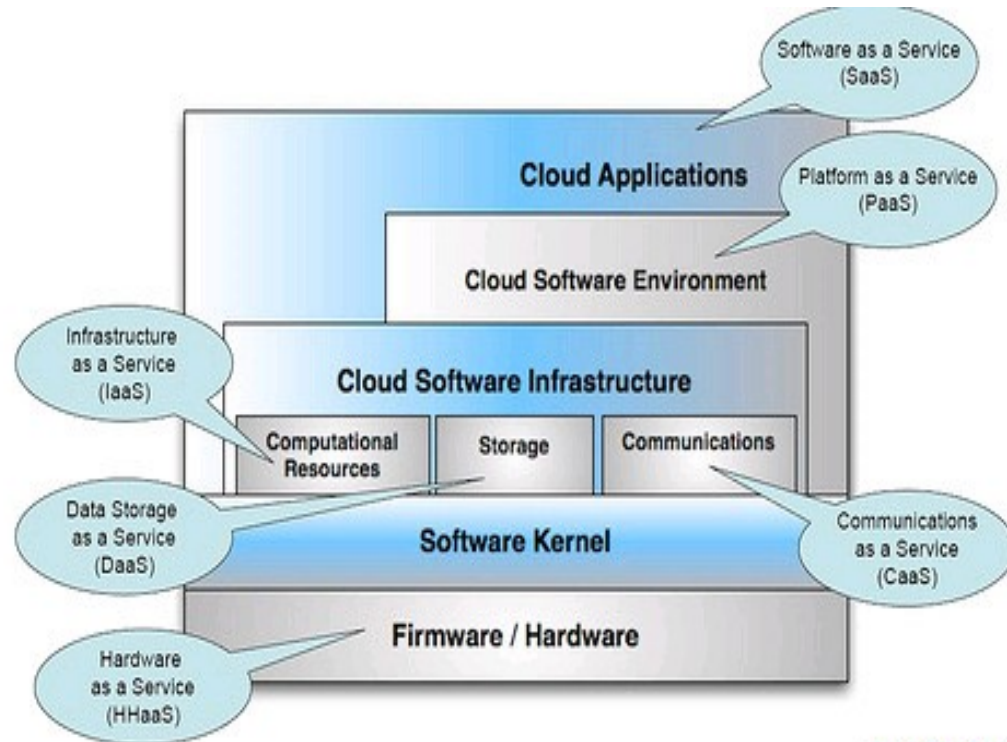

Software-as-a Service (SaaS)

- Type

Public Cloud

Private Cloud

Hybrid Cloud

# Software as a Service ( SaaS )

- Vendor / Provider controlled application accessed over the network
- Characteristics :
  - Network based access
  - Multi-tenancy
  - Single software release for all
  - browser based client and client tools
- Disadvantages :
  - dependency on network and cloud provider
  - limited client bandwidth
  - cloud service provider in charge of the data

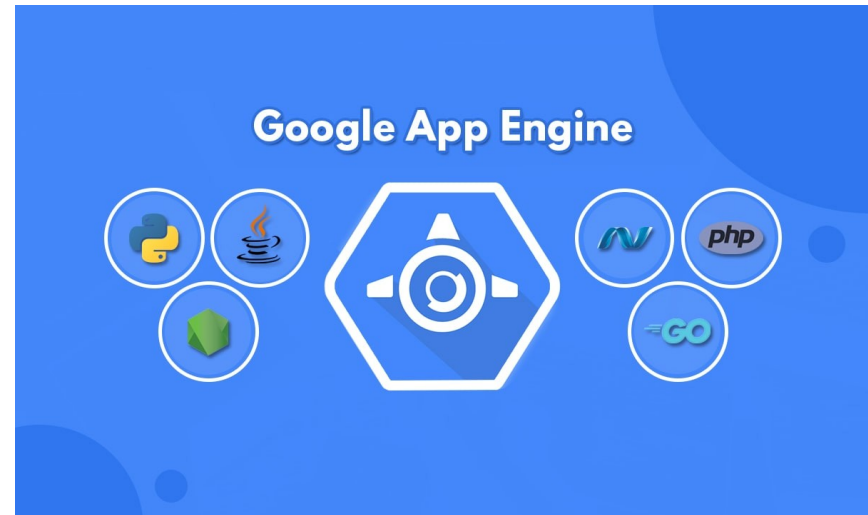

Google Docs

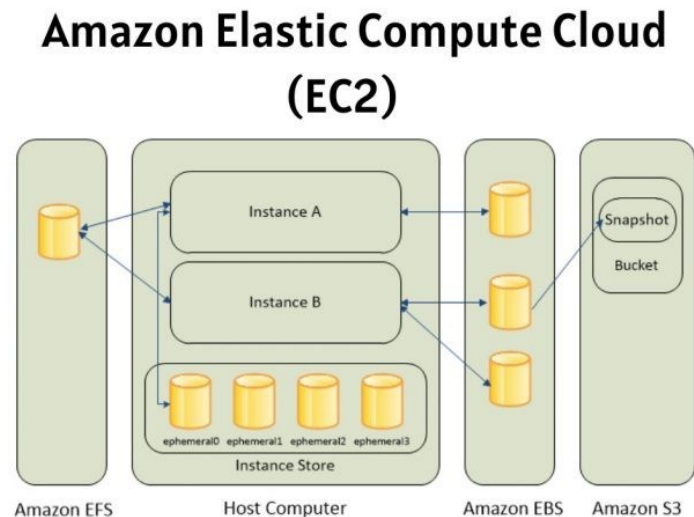

# Platform as a Service ( PaaS )

- Vendor provided deployment environment tools and technology selected by the vendor ( control over data life cycle )
- Characteristics :
  - Rapid development and deployment
  - Small startup cost
  - multi-tenancy
  - load balancing and fail over
  - native integrated environment – performance, load
- Disadvantages :
  - inherits all disadvantages from SaaS
  - choice of technology limited to vendor provided tools and services

# Infrastructure as a Service ( IaaS )

- Vendor provided and consumer provisioned computing resources
- Characteristics :
  - Consumer is provided customized virtual machines
  - Consumer has control over OS, memory, storage, servers and deployment configurations
  - limited control over network resources
  - infrastructure scalability
  - economical cost

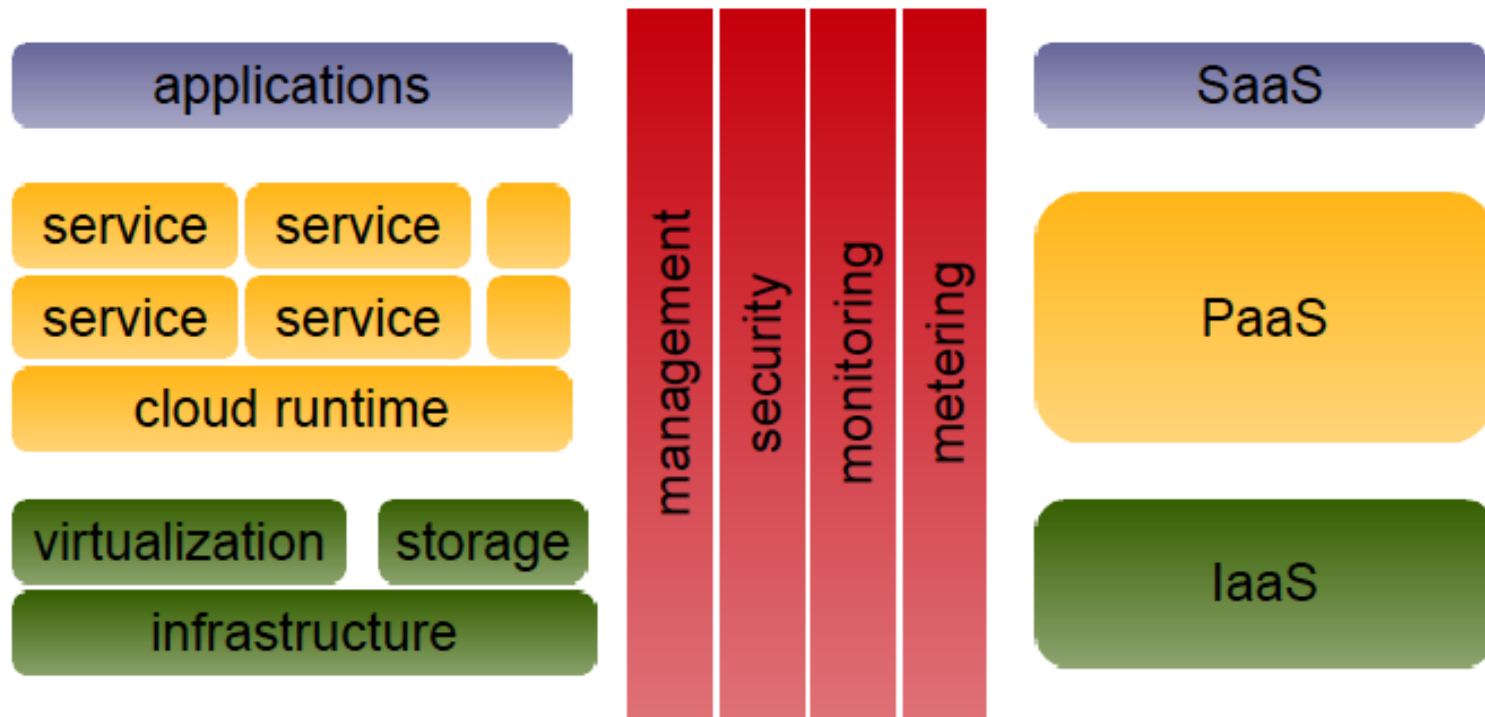

# Cloud Services and Control

In-house Deployment	Hosted Deployment	IaaS Cloud	PaaS Cloud	SaaS Cloud
Data	Data	Data	Data	Data
APP	APP	APP	APP	APP
VM	VM	VM	Services	Services
Server	Server	Server	Server	Server
Storage	Storage	Storage	Storage	Storage
Network	Network	Network	Network	Network
Organization controlled	Organization & service provider share control		Service Provider controlled	

[1] Visualizing the Boundaries of Control in the Cloud. Dec 2009.  
<http://kscottmorrison.com/2009/12/01/visualizing-the-boundaries-of-control-in-the-cloud/>

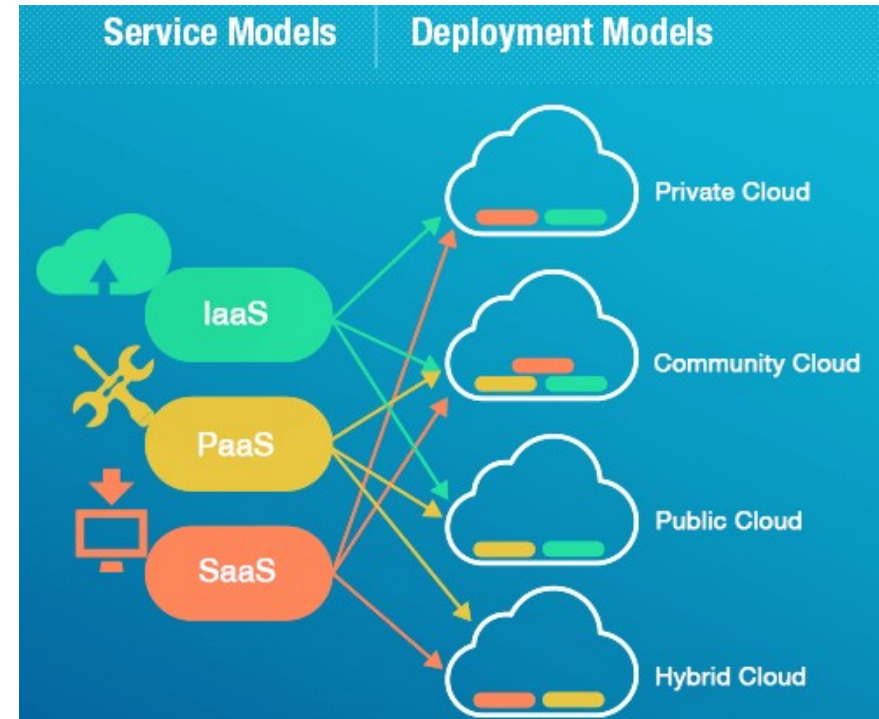

# Cloud Services Reference Model

# Cloud Deployment Models

- Private Cloud
  - infrastructure operated by an organization
  - managed by organization and third party
- Community cloud
  - supports a specific community
  - infrastructure shared by several organizations
- Public cloud
  - infrastructure is made available to public
  - owned by an organization selling cloud services
- Hybrid cloud
  - infrastructure is a composition of two or more cloud deployment models
  - enables data and application portability

# Cloud Distributed Storage

- Distributed Storage : Two approaches of scaling

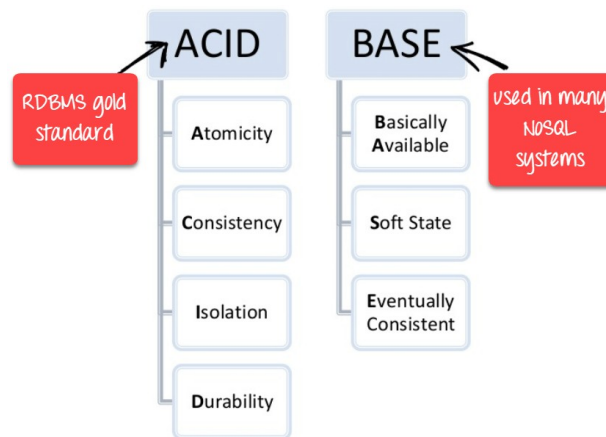

- Vertical - bigger hardware
- Horizontal – more hardware  
( horizontal partitioning, functional partitioning)

- CAP Theorem \*

- web services cannot ensure all the three of the following properties at once :

- consistency : set of operations has occurred all at once
- availability : an operation must terminate in an intended response
- partition tolerance : operations will complete even if individual components are unavailable

\* Eric Brewer, University of California, Berkeley

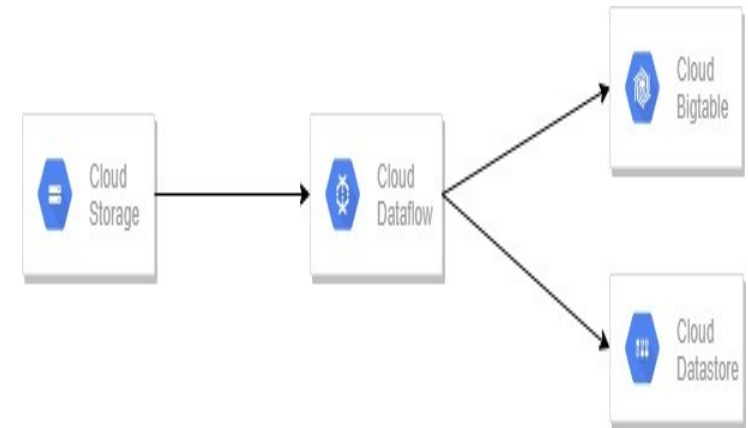

# Cloud Distributed Storage

- General Characteristics :
  - Simplified data model
  - Built on Distributed File System
    - GFS – Google File System
    - HDFS – Hadoop Distributed File System

- Highly Available – Relaxed Consistency

- Fault-Tolerant – Replication

- Eventual Consistency – all replicas will be updated in different time and in different order

# Cloud Distributed Computation

## • Motivation

- distributed computing – thousands of computers
- large data sets
- fault tolerant
- easy to configure and manage

## • Basic idea : functional programming

- large problem broken into simpler problems ( functional decomposition )
- each small problem can be solved by a functional transformation of input data

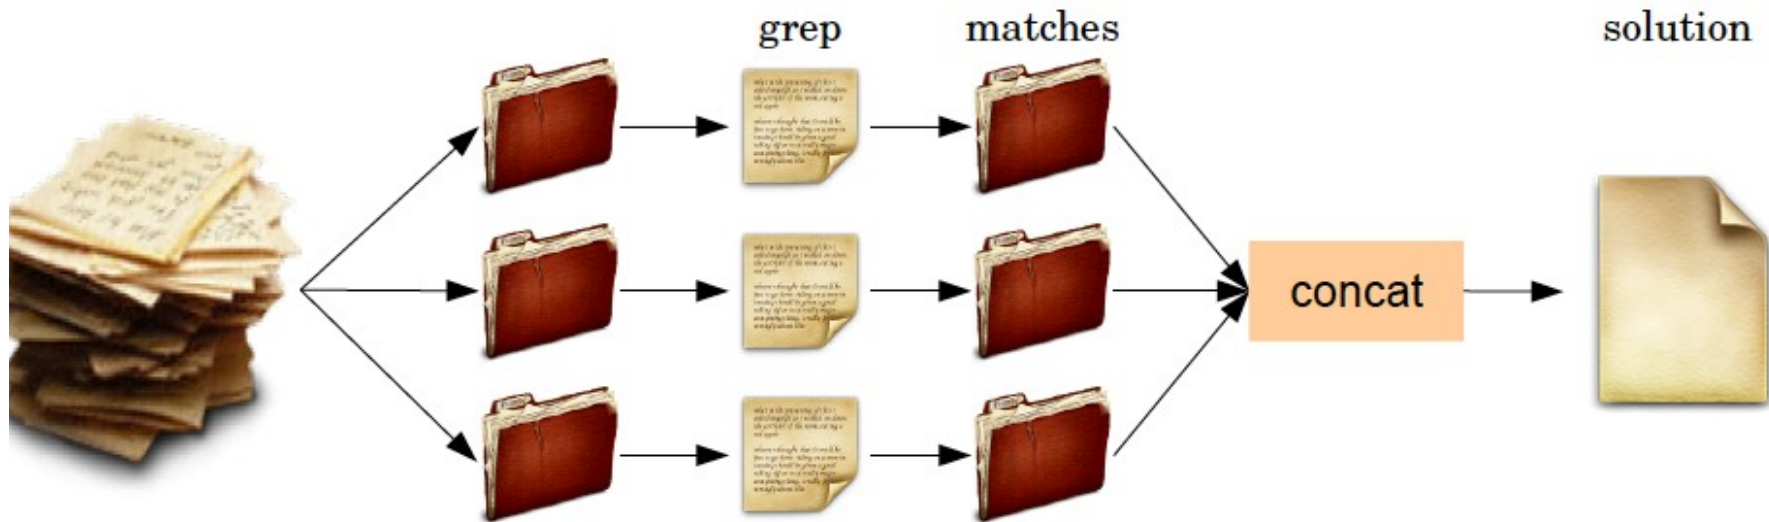

- each problem can be executed in complete isolation

## • Server to solve big problem

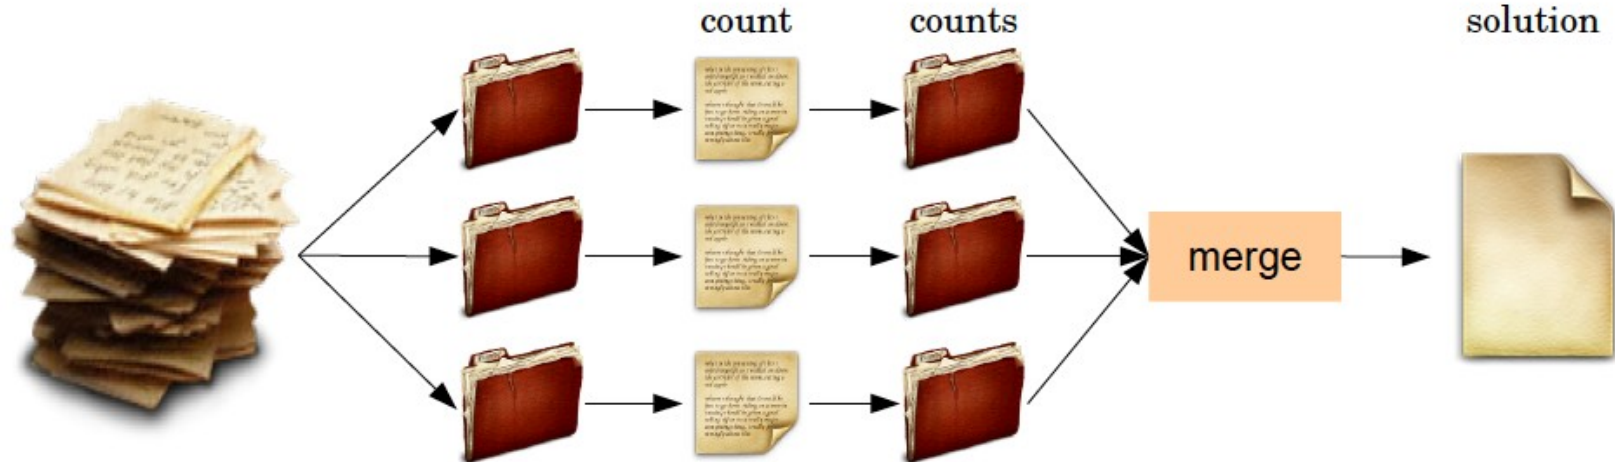

# Cloud Distributed Computation

## Distributed *grep*

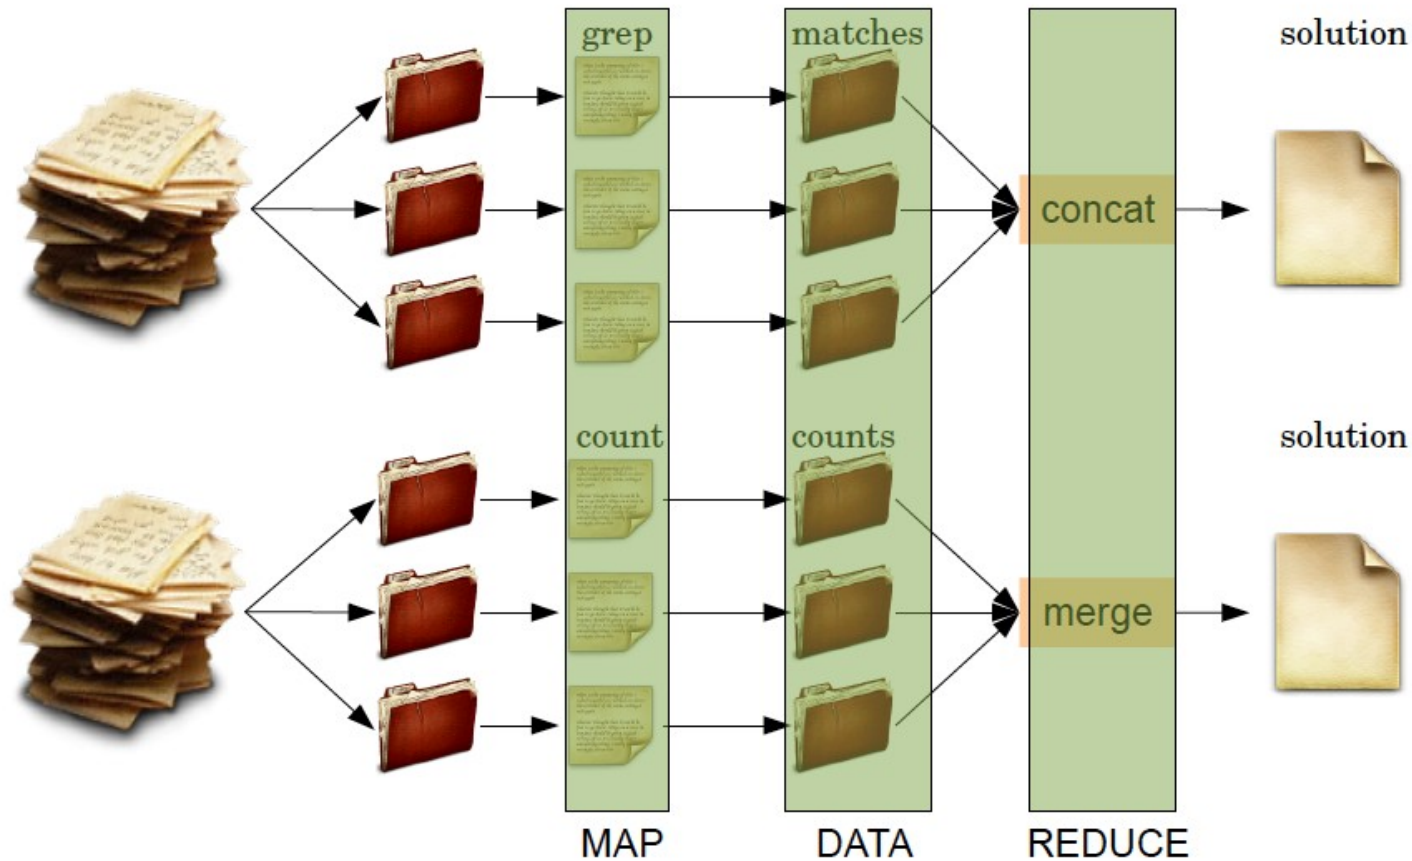

# Cloud Distributed Computation

## Distributed *word count* (*wc*)

# Cloud Distributed Computation : Map Reduce

# Obstacles and Opportunities for Cloud Computing

	Obstacle	Opportunity
1	Availability of Service	Use Multiple Cloud Providers to provide Business Continuity; Use Elasticity to Defend Against DDOS attacks
2	Data Lock-In	Standardize APIs; Make compatible software available to enable Surge Computing
3	Data Confidentiality and Auditability	Deploy Encryption, VLANs, and Firewalls; Accommodate National Laws via Geographical Data Storage
4	Data Transfer Bottlenecks	FedExing Disks; Data Backup/Archival; Lower WAN Router Costs; Higher Bandwidth LAN Switches
5	Performance Unpredictability	Improved Virtual Machine Support; Flash Memory; Gang Scheduling VMs for HPC apps
6	Scalable Storage	Invent Scalable Store
7	Bugs in Large-Scale Distributed Systems	Invent Debugger that relies on Distributed VMs
8	Scaling Quickly	Invent Auto-Scaler that relies on Machine Learning; Snapshots to encourage Cloud Computing Conservationism
9	Reputation Fate Sharing	Offer reputation-guarding services like those for email
10	Software Licensing	Pay-for-use licenses; Bulk use sales

*Slide Adapted from : Above the Clouds: A Berkeley View of Cloud Computing (February 10, 2009)*

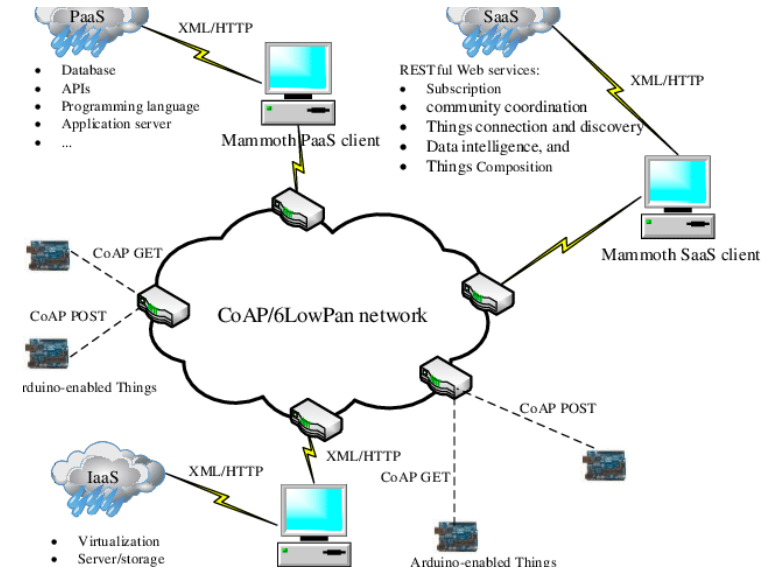

# Cloud Computing for IoT

Cloud is an IoT enabler :

Huge amount of IoT Data needs storage, retrieval and management ( sustained services)  
Fast Analytics for Prediction and Critical Decision making

Benefits of Cloud in IoT :

Scalability ; Data Mobility; Time to Market; Security; Cost effectiveness

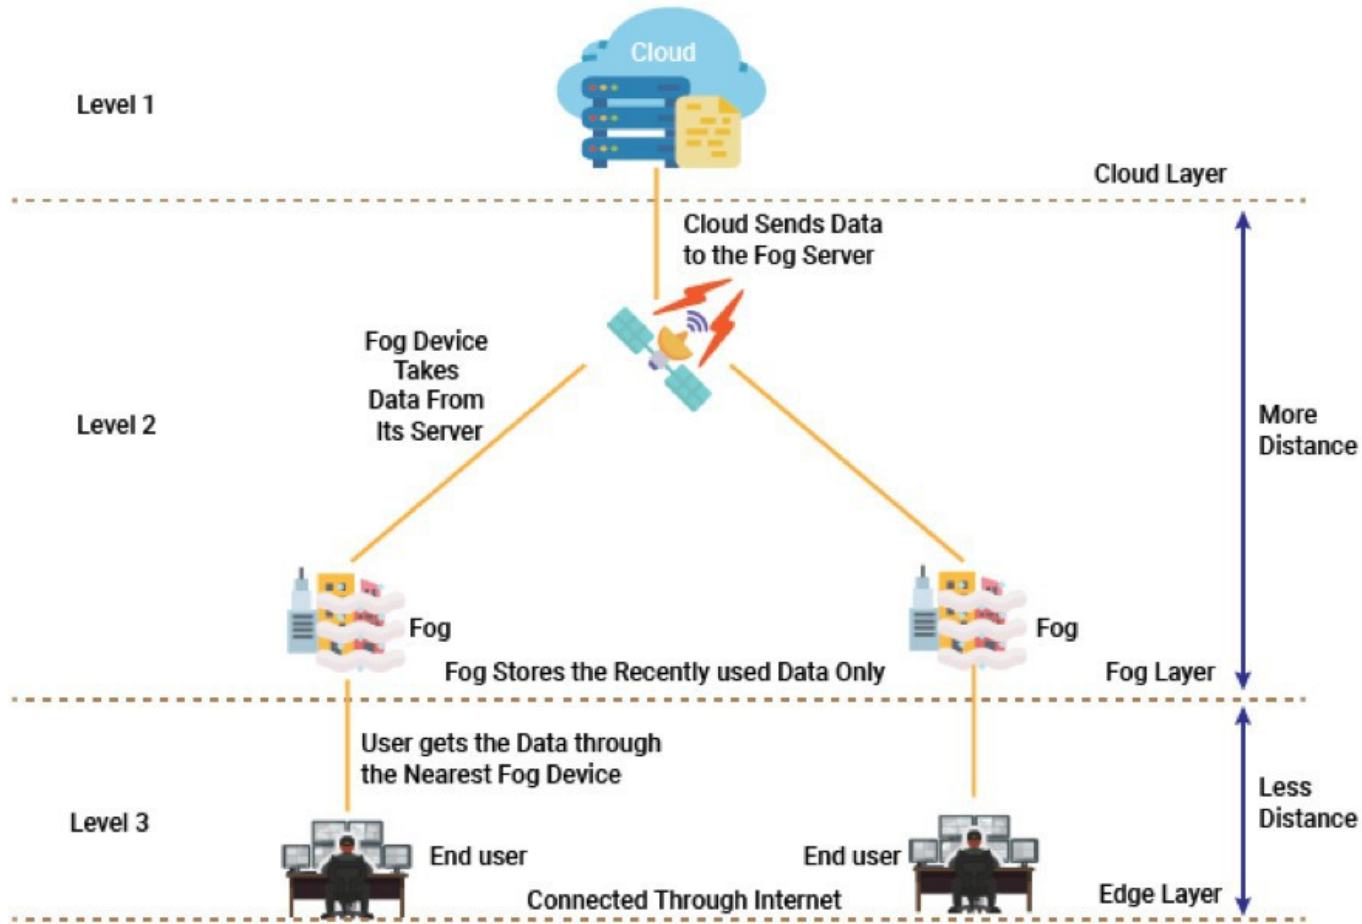

# Challenges in Using Cloud Platform for IoT

Source : Internet

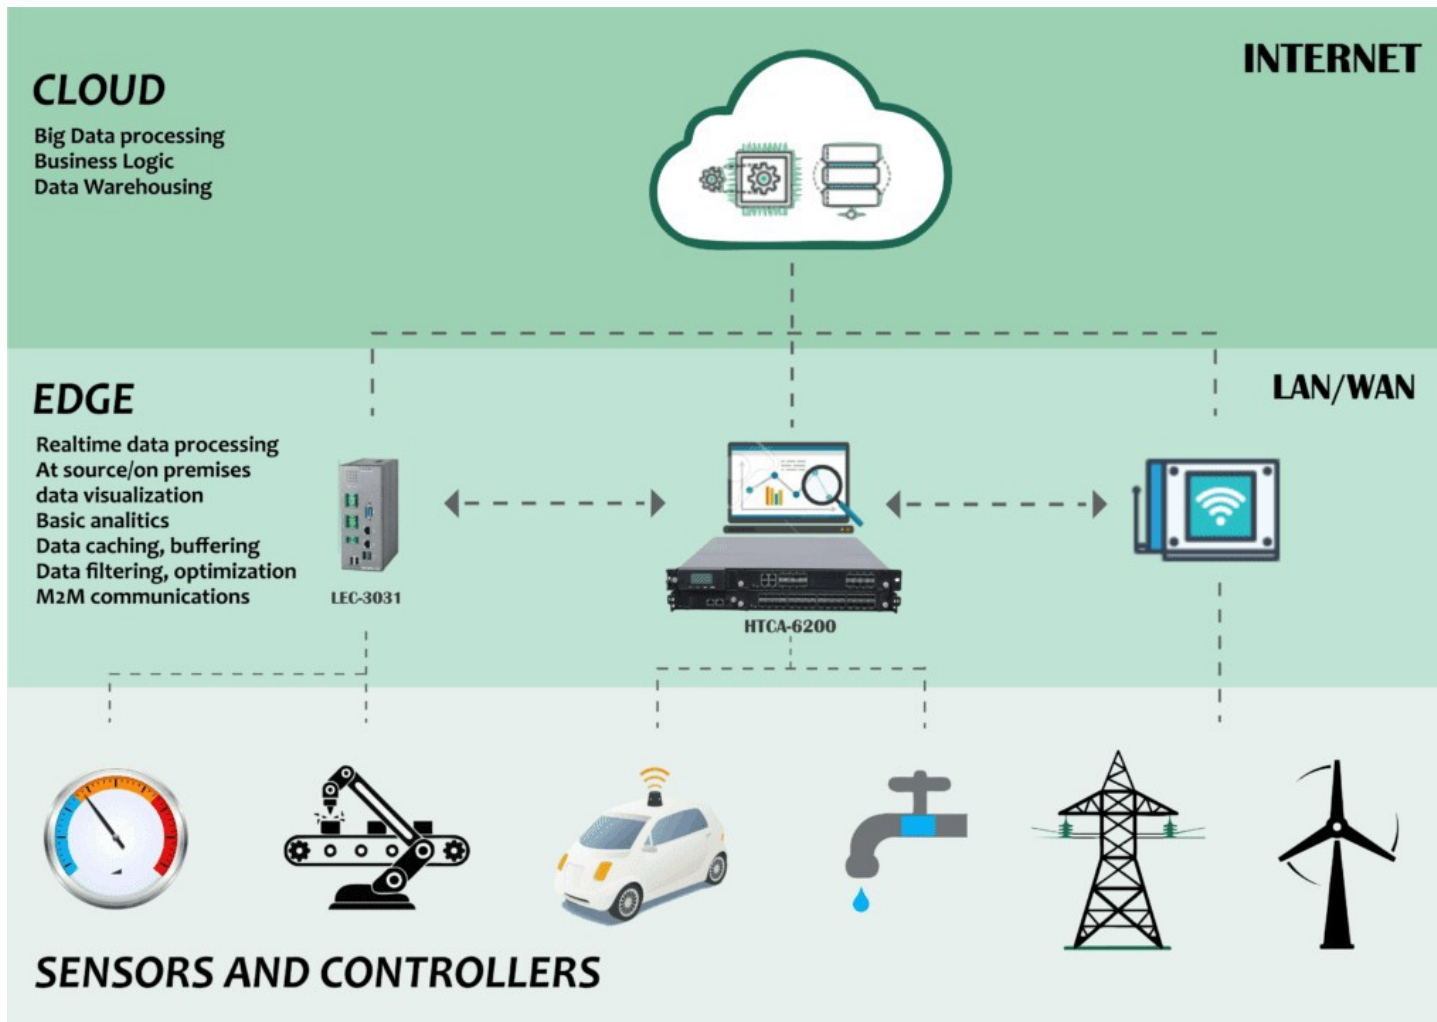

# Fog Computing

Source : Internet

# Edge Computing

Benefits of Edge Computing :

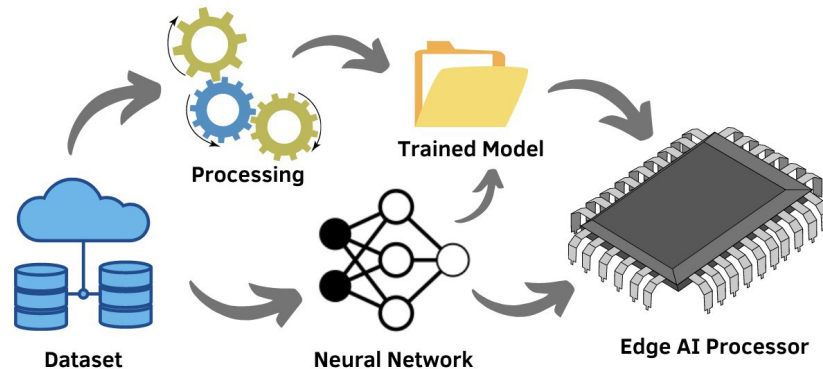

1. Faster Response Time
2. Reliable Operations with intermittent connectivity
3. Security and Compliance
4. Cost-Effective Solutions
5. Interoperability between Legacy and Modern Devices

Source : Internet

# Edge AI

## Edge Computing + Artificial Intelligence = Edge AI

AI algorithms are executed locally on a hardware device using the data collected from Edge computing.

AI computation is done near the user at the edge of the network, close to where the data is located

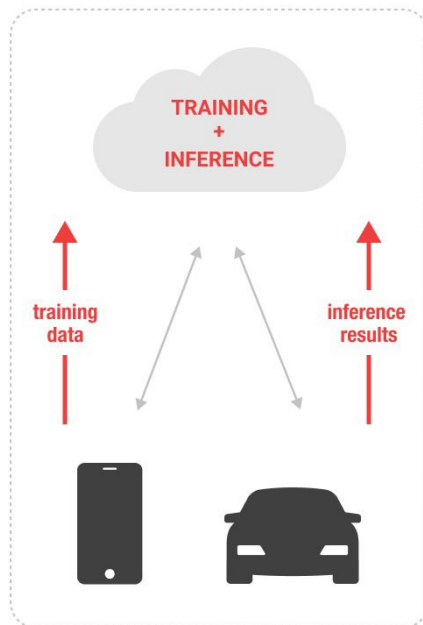

Benefits :

1. Reduces latency
2. Reduces power consumption
3. Reduces Data Cost

Source : Internet

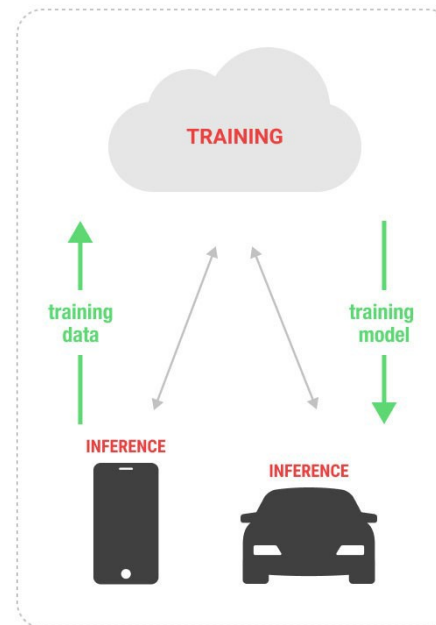

# Edge AI Vs. Cloud AI

**AI processing using only the cloud**

- Increase in amount of data transmissions
- Large impact on data latency
- Large impact on transfer disconnections

**Processing shared between cloud and edge**

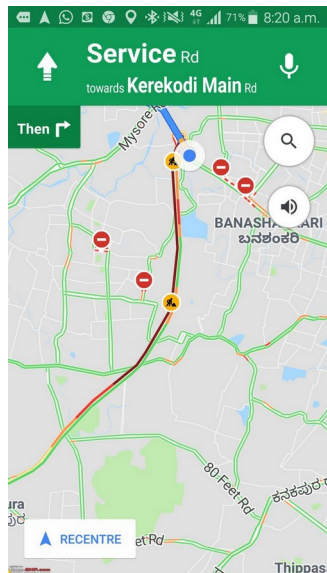

- Reduces amount of data transmission
- Lower impact on data latency
- Lower impact on transfer disconnections

Cloud  
Edge

Source : Internet

# Edge AI in Use

### ACTIVE SAFETY SYSTEMS

- Constantly monitor the performance and surroundings of a vehicle
- Can prevent accidents from happening altogether ...or actively help the driver to reduce the impact
- Avoid or mitigate an accident **pre-impact**, so before it happens

A diagram of a yellow car with various sensors and systems indicated by colored lines and icons: red for collision avoidance, blue for lane departure, and green for emergency braking.

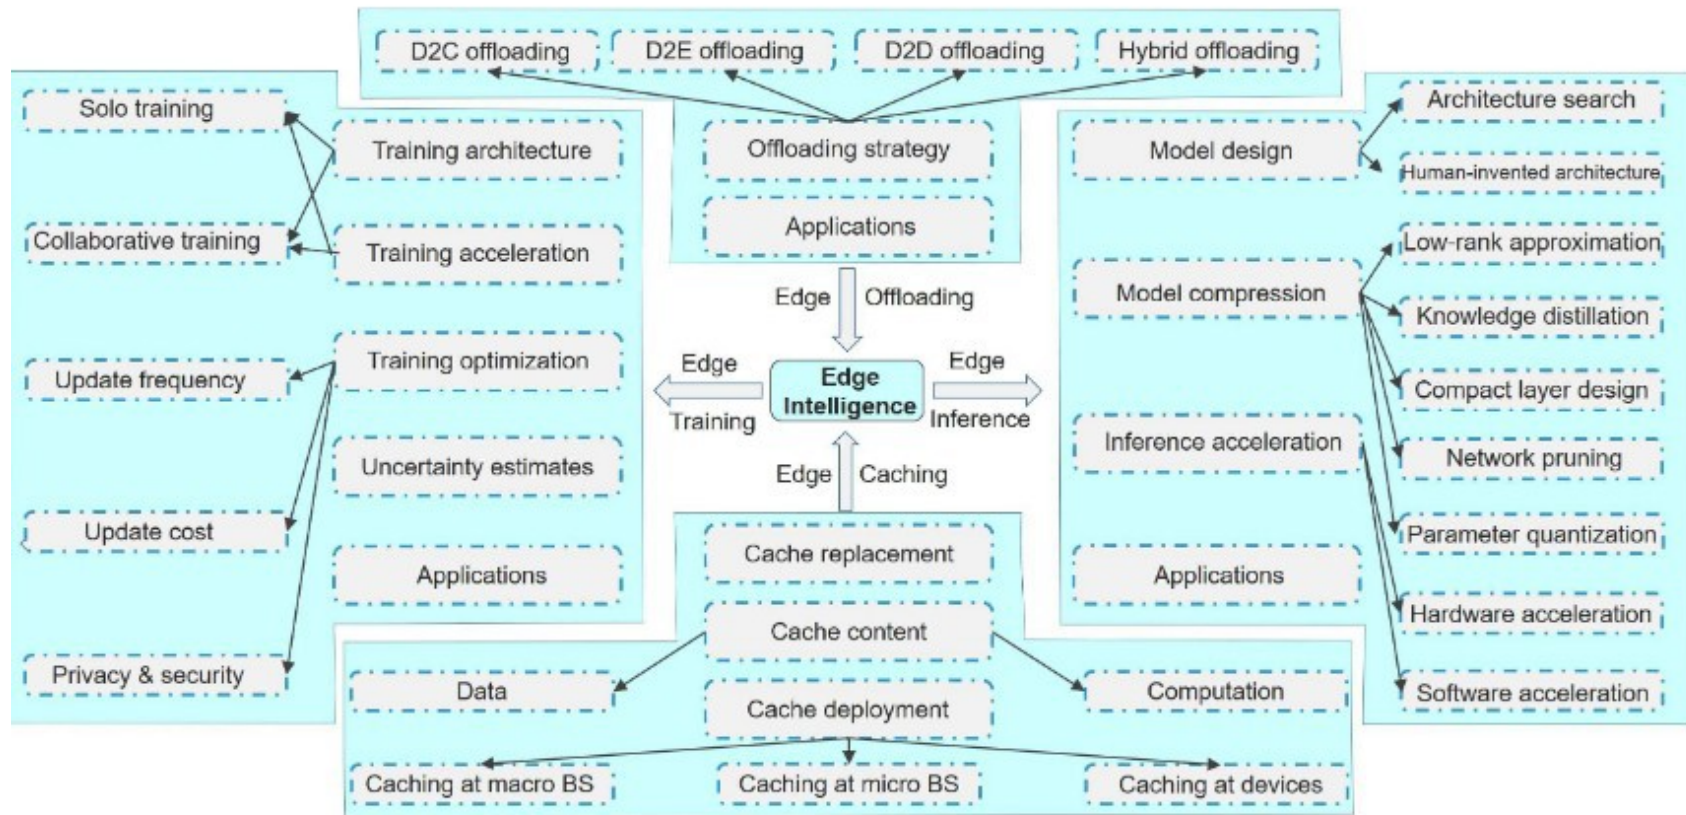

### EXAMPLES OF ACTIVE SYSTEMS THAT GIVE THE DRIVER MORE CONTROL IN DANGEROUS SITUATIONS:

- Anti-lock braking (ABS)
- Electronic stability control (ESC)
- Autonomous emergency braking (AEB)
- Lane departure warning (LDW)
