HTTP for IoT

Constrained Application Protocol (CoAP)

A specialized web transfer protocol for use with constrained nodes and constrained networks in Internet of Things

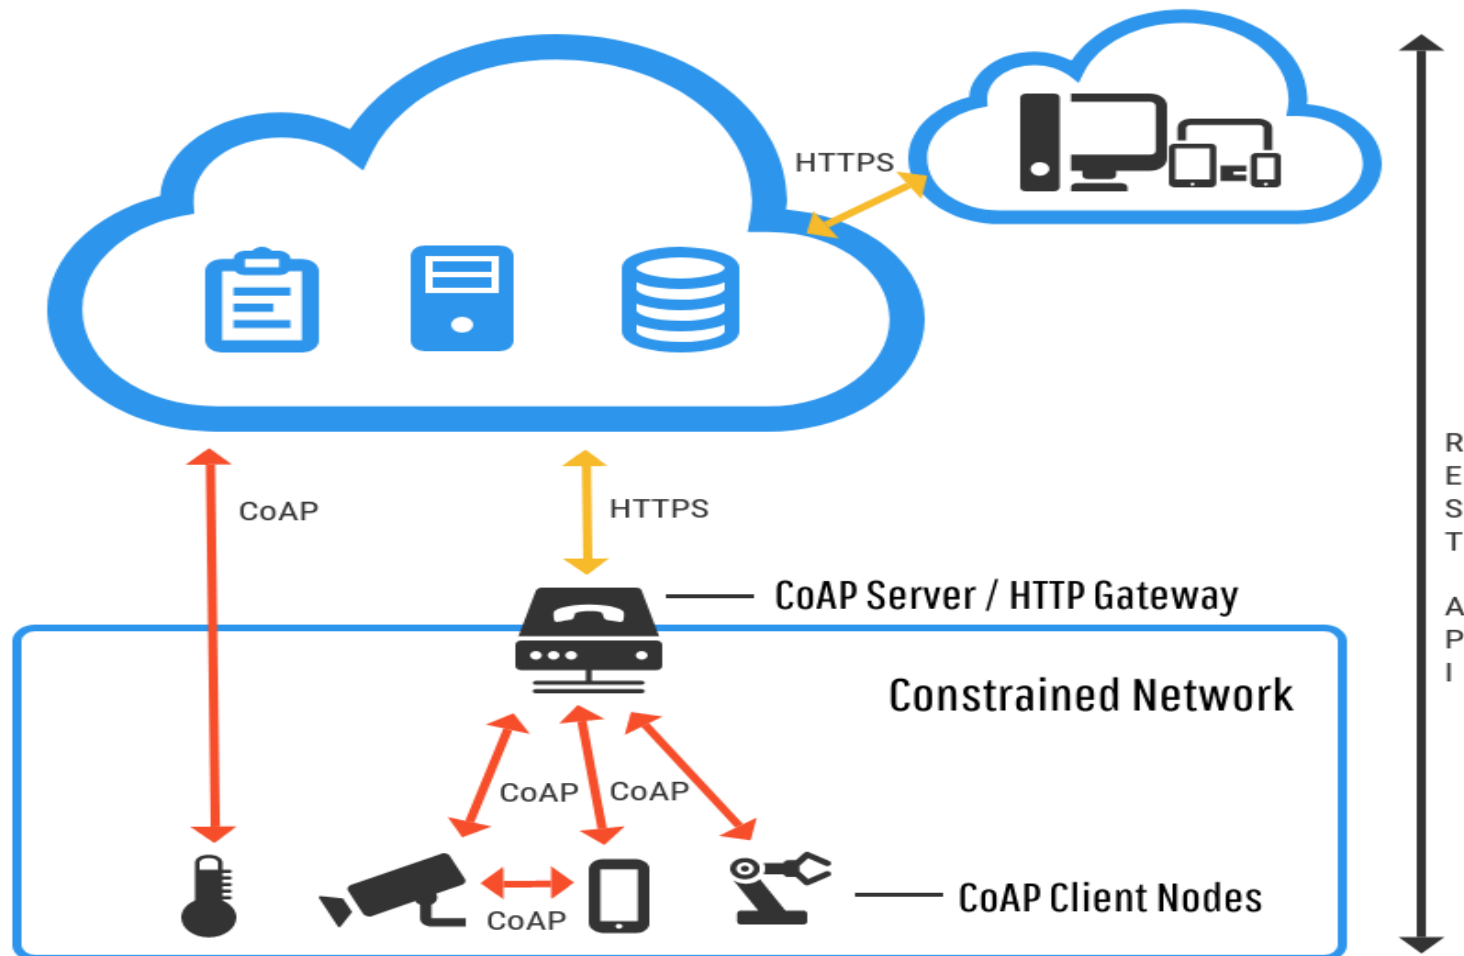

- CoRE , IETF group
- Uses both request/response and publish/subscribe model
- Proposed Standard : RFC 7252
- Lightweight fast HTTP
- Designed for manipulation of simple resources on constrained node networks
- CoAP is designed to use low power sensors to use RESTful services while meeting power constraints.

CoAP

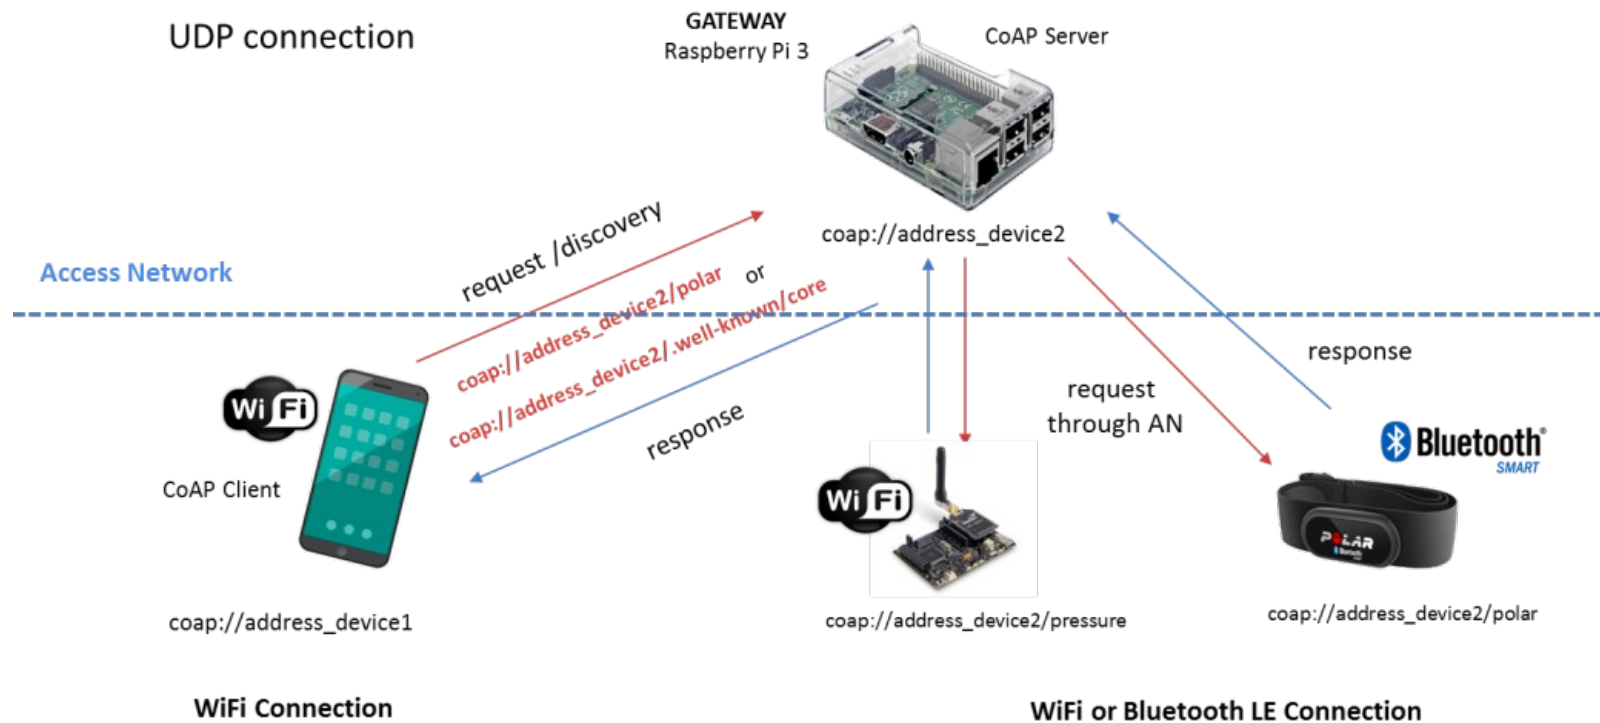

- **Built over UDP, instead of TCP (commonly used with HTTP) and has lightweight mechanism to provide reliability**
- **CoAP Architecture has two sublayers :**
 - Messaging – reliability and duplication of messages
 - Request/Response – communication
- **CoAP Messaging Modes :**
 - Confirmable
 - Non-confirmable
 - Piggyback
 - Separate

CoAP Architecture

Device to Device Using CoAP

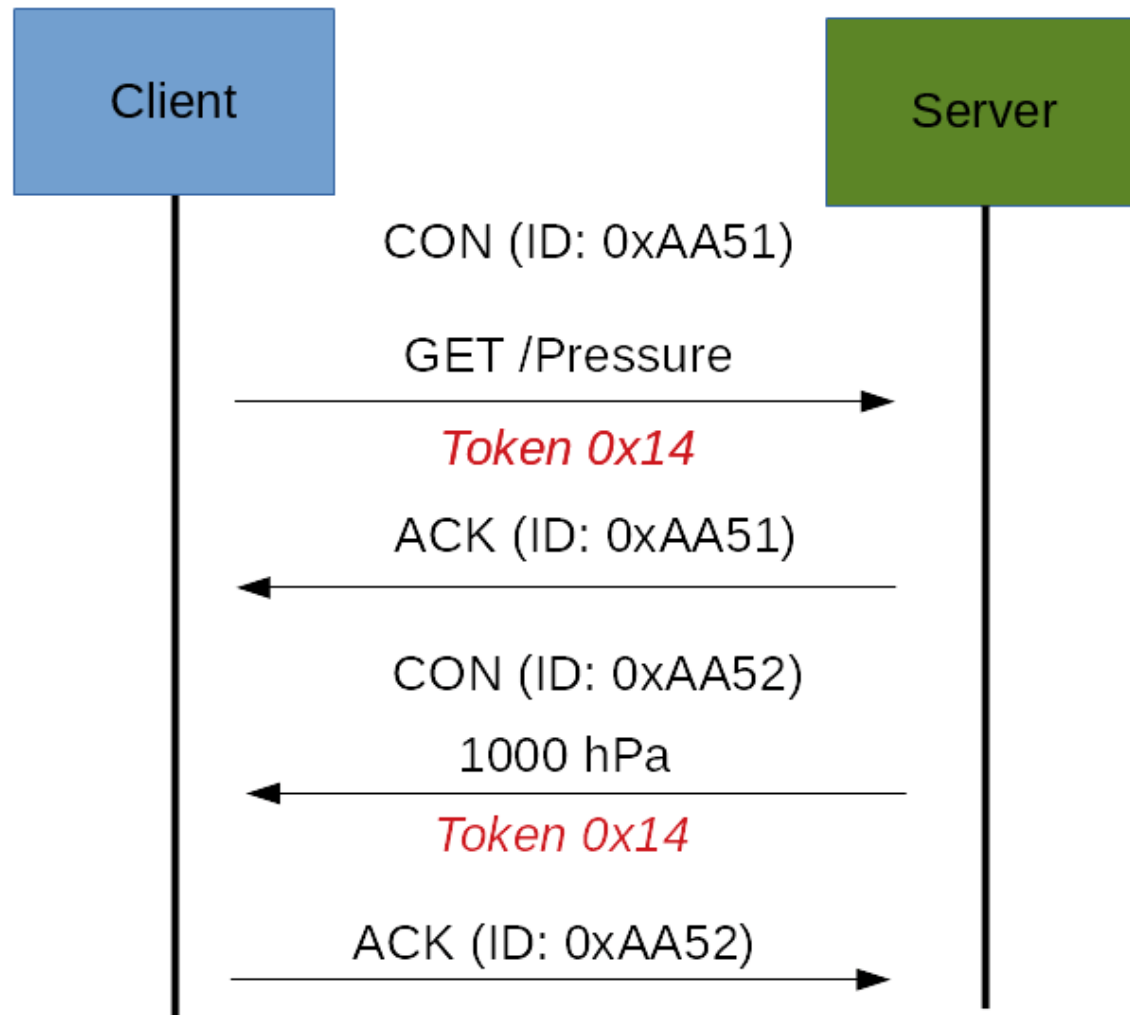

Uses case device to device using CoAP

CoAP Message Types

- **Confirmable and non-confirmable modes represent reliable and unreliable transmissions**
- **Other modes are used for request/response**
- **Piggyback is used for client/server direct communication where server sends its response directly after receiving message i.e. within acknowledgement message**
- **Separate mode is used when server response comes in a message other than acknowledgement**
- **CoAP uses GET, POST, PUT and DELETE messages**

CoAP Request Response

CoAP Request Response

CoAP – Request Response

Diagram illustrating the components of a CoAP URI:

URI: `coap://myhome.in:5683/nest_bedroom/temp`

- Name of the protocol: `coap`
- Port (5683 is the default port CoAP uses): `5683`
- Name of the device: `nest_bedroom`
- Name of the parameter device controls (temperature here): `temp`

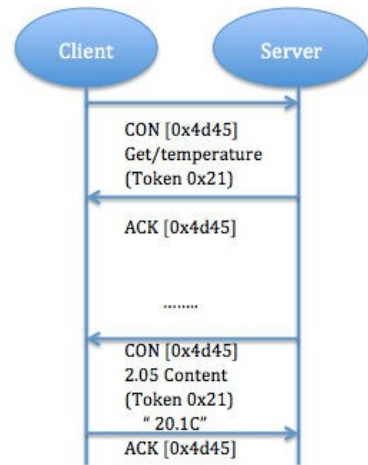

Confirmable and Non-Confirmable Mode

(a) Reliable Transmission

(b) Unreliable Transmission

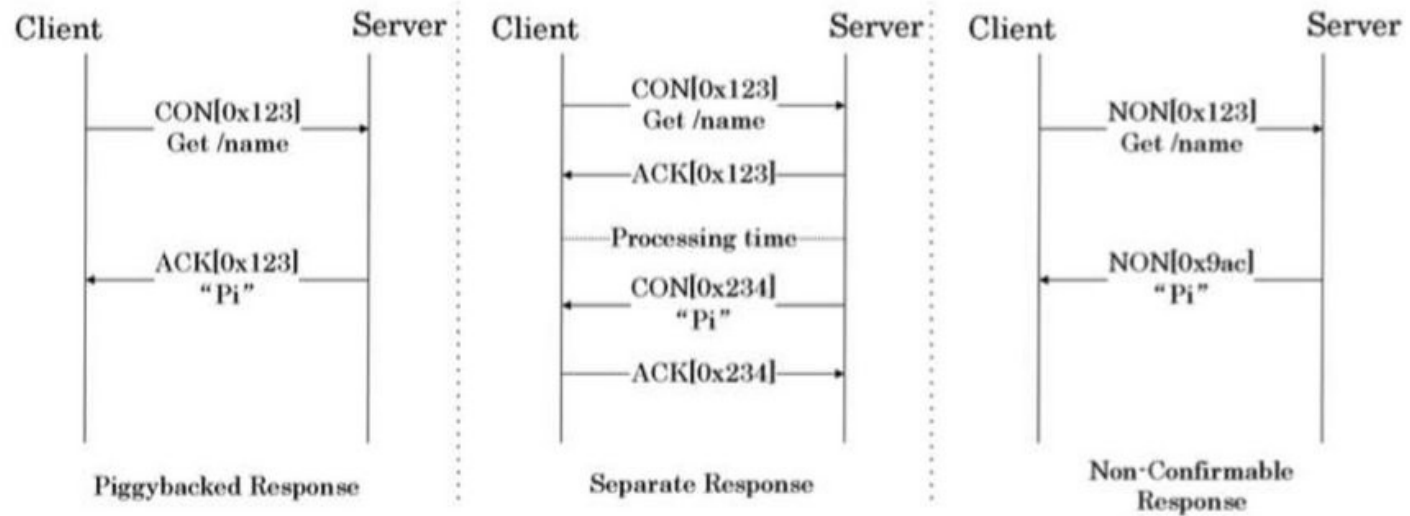

(c) Confirmable Request and Separate Confirmable Response

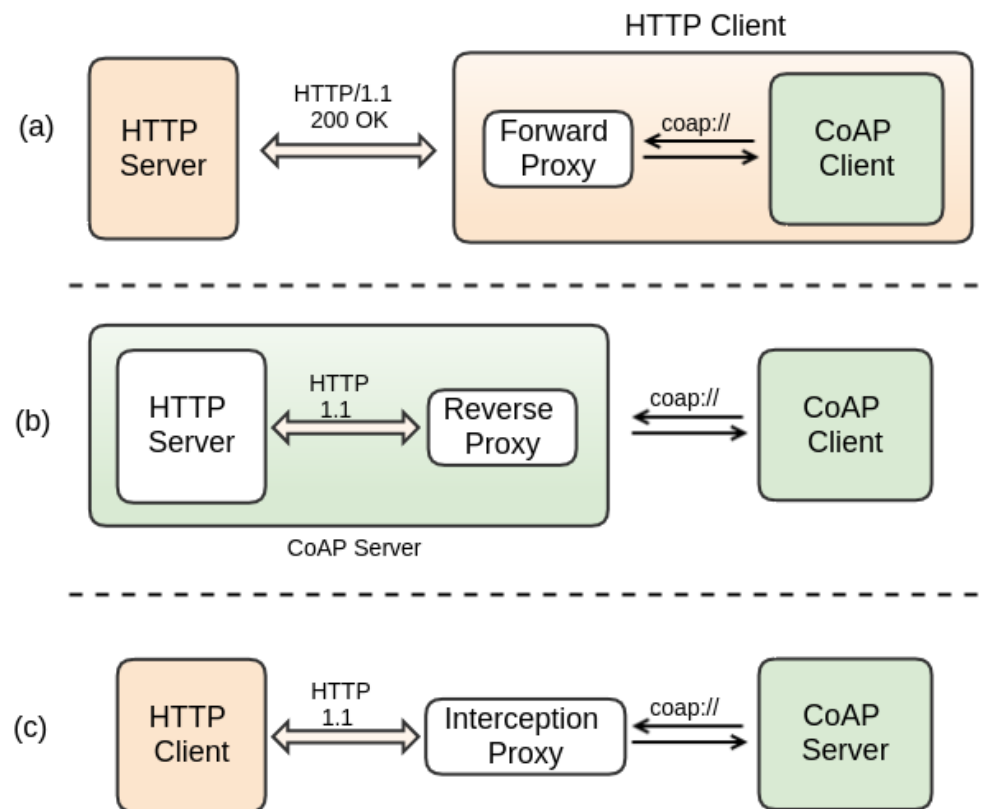

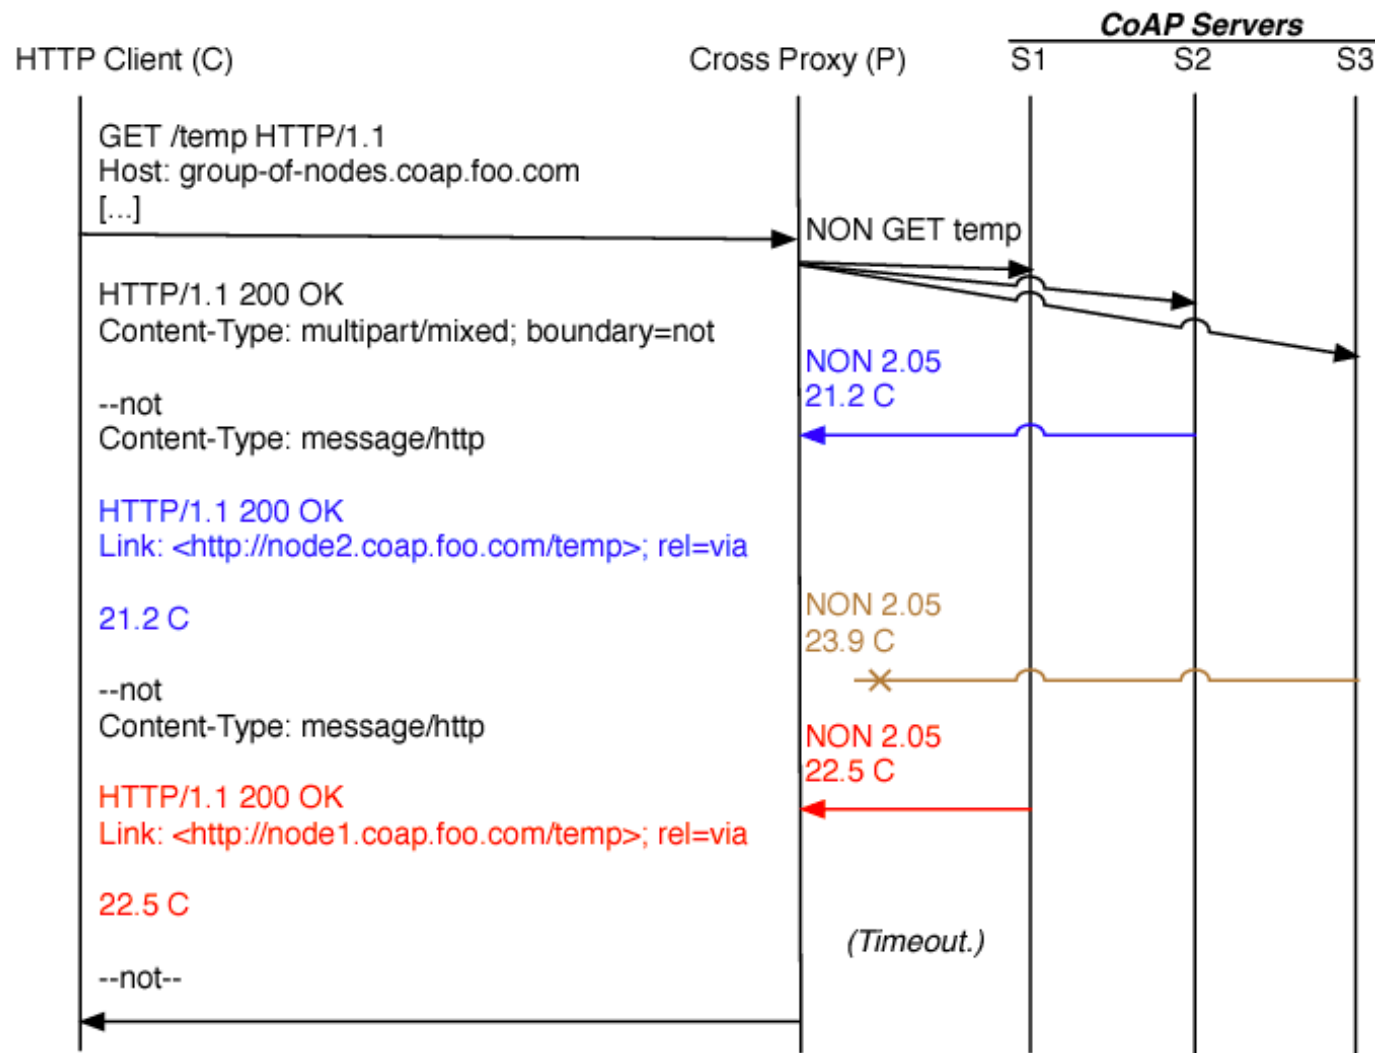

(d) Non-Confirmable Request and Non-Confirmable Response

CoAP Request and Response

CoAP-HTTP Proxy

CoAP Functionalities

- **URI**
- **GET/POST/PUT/DELETE**
- **Content type support – XML, JSON**
- **Built-In Discovery**
- **Multicast support**
- **Asynchronous message exchanges**
- **Designed to be extensible**

CoAP Message Format

CoAP Message Format

Byte	0								1								2								3											
Bit	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7				
Field	Ver		T		TKL				Code								Message ID																			
	Token (if any, TKL bytes)																																			
	Options																																			
	1	1	1	1	1	1	1	1	1	Payload																										

Ver - Version (1)

T – Message Type (Confirmable, Non-Confirmable, Acknowledgement, Reset)

TKL- Token Length, if any, the number of Token bytes after this header

Code - Request Method (1-10) or Response Code (40-255)

Message ID – 16-bit identifier for matching responses

Token – Optional response matching token
