

# SDN in IoT

Dr. Bibhas Ghoshal

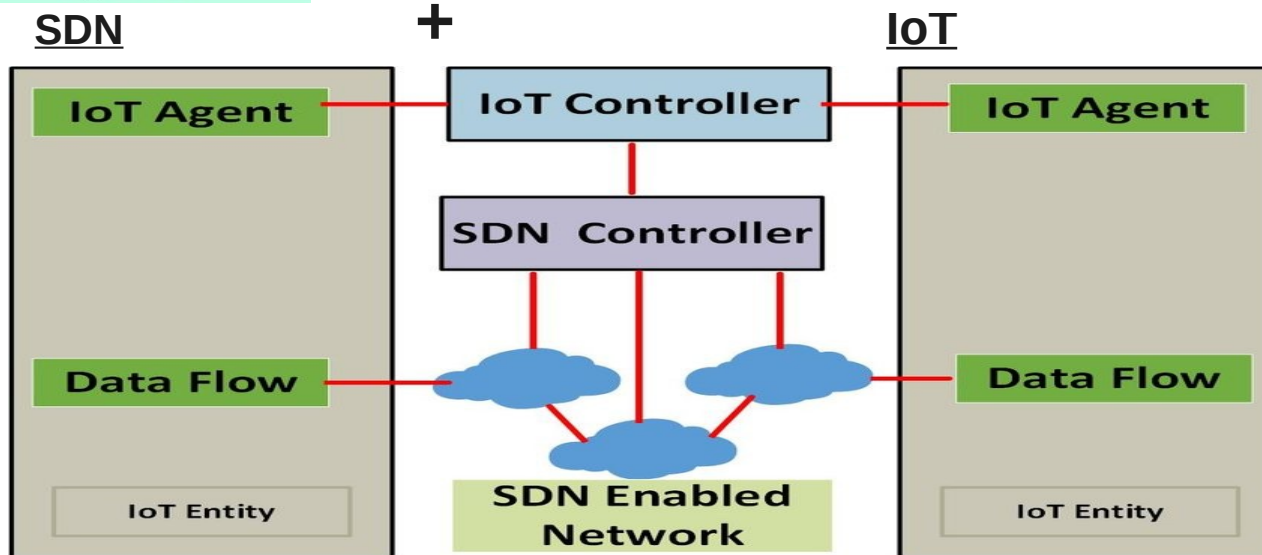

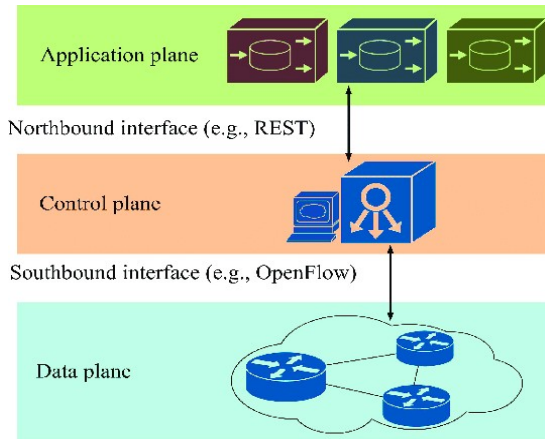

IIIT Allahabad

# Why SDN in IoT ?

- Intelligent routing decisions
- Decision making after analysing traffic pattern
- Visibility of network resources facilitating easy network management

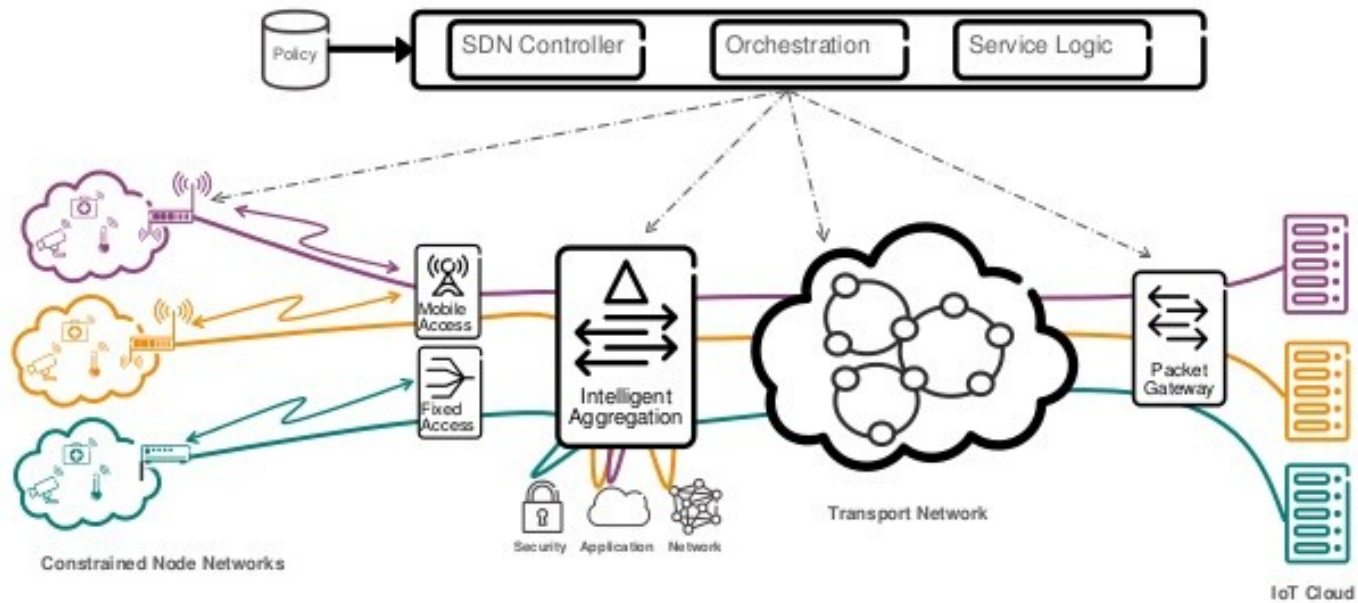

# SDN for IoT

SDN in IoT

# SDN for IoT

## IOT NETWORKS

# SDN for Wireless Sensor Networks

## Challenges in Wireless Sensor Network

- Constrained environment – limited memory and computing power
- Architecture is Vendor Specific
- Real time programming of sensor nodes

## How to ensure?

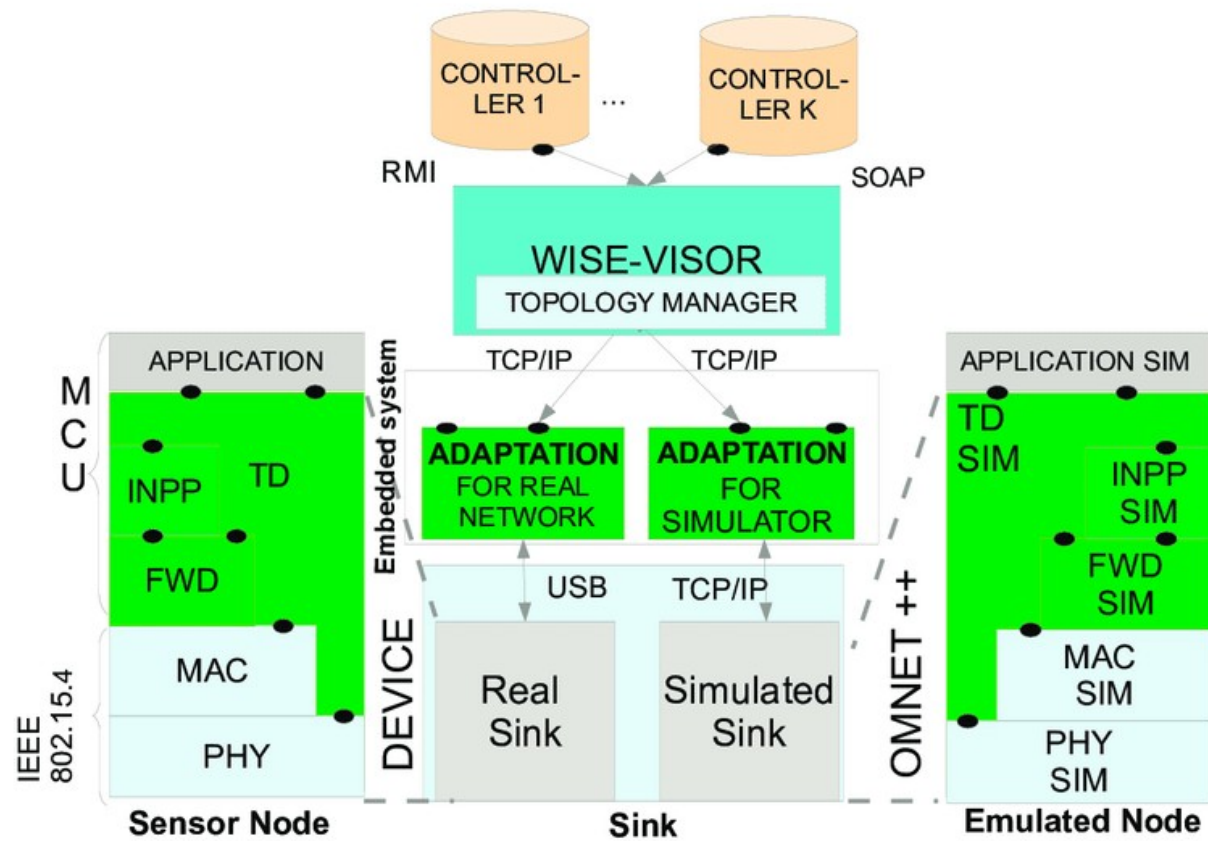

- Real time programming of sensor nodes and forwarding path
- Integrate different sensor nodes in WSN

# Software Defined SDN

- **Sensor Open Flow ( Luo et al., IEEE Comm. Letters '12)**
  - Data forwarding based either source node id or if it exceeds some threshold
- **Soft WSN ( Bera et al., IEEE SJ'16)**
  - Implementing multiple sensors on a single board, change sensing delay dynamically, change active and sleep mode dynamically
- **SDN WISE ( Galluccio et al., IEEE INFOCOM'15)**
  - Software defined WSN platform
  - Design of Flow table for rule placement at sensor nodes
  - Any programming language can be used

# SDN WISE Protocole Stack [Galluccio et al. IEEE INFOCOM'15]

# SDN for Mobile Networking

- **Flow Table Paradigm of SDN**

- Well suited for end-end communication over multiple technologies such as 3G, 4G and WiFi

- **Logically Centralized Control**

- **Path Management**

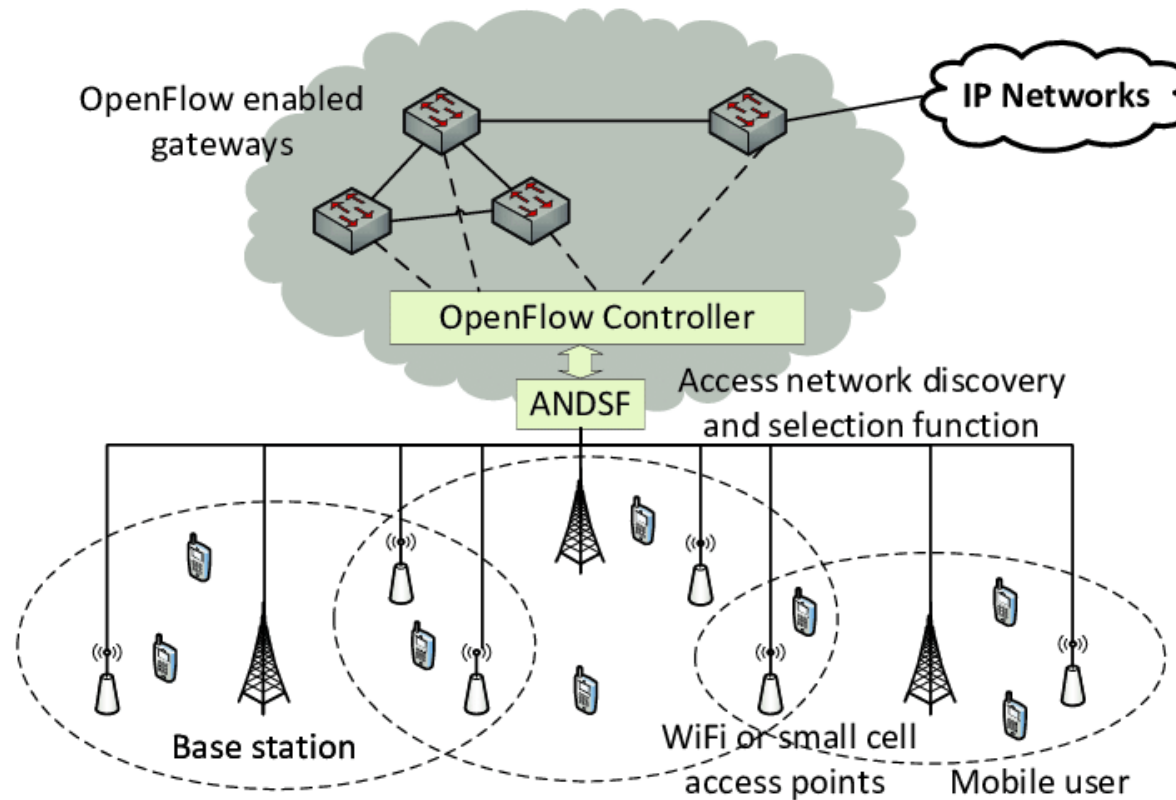

- Data routed on the basis of service requirement

- **Network Virtualization**

- Abstracts physical resources from network services

# SDN For Mobile Networking : Mobile Data Offloading

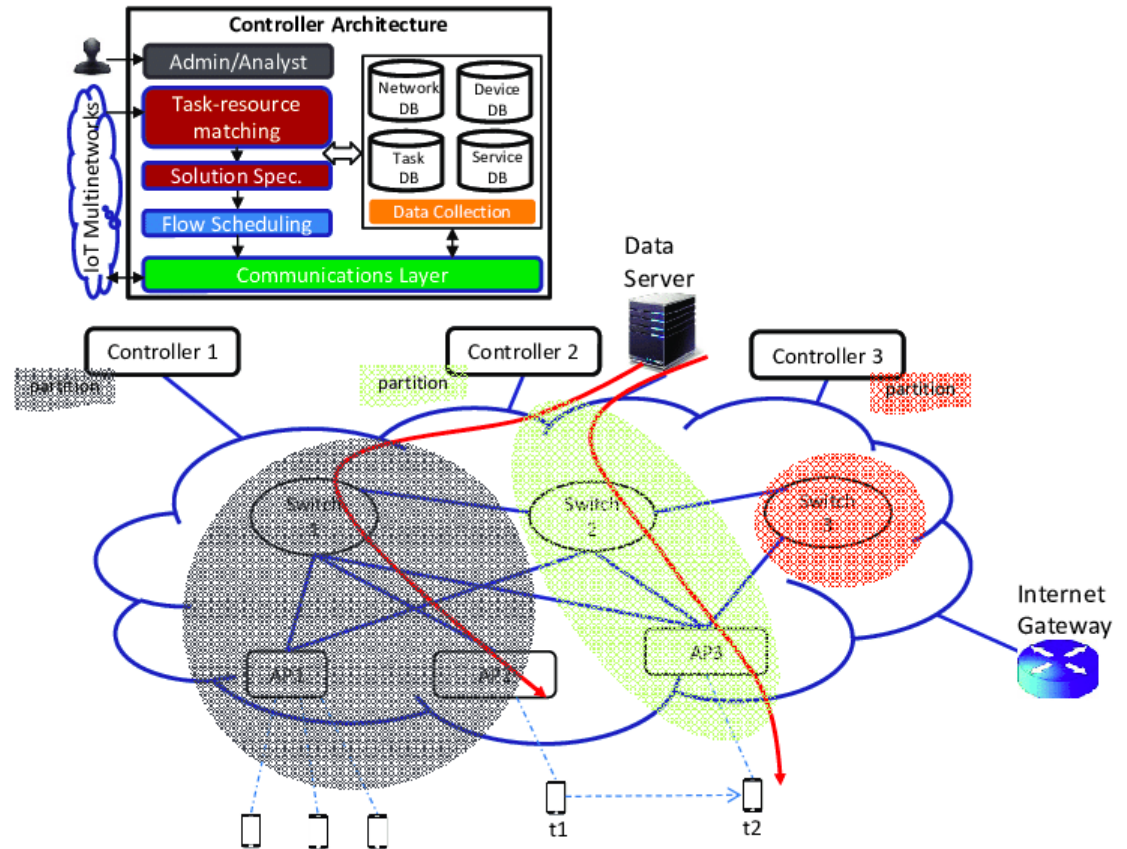

# Ubi - Flow : Software Defined IoT

- **Mobility Management in SDIoT**

- Scalable control
- Fault Tolerance

- **Flow Scheduling**

- Network Partition
- Network Matching
- Load Balancing

*Ubi-Flow : Mobility Management in Urban-Scale Software Defined IoT, IEEE Infocom, 2015*

# Mobility Aware Flow Rule Placement

*Mobility Aware Flow Table Implementation in Software Defined IoT, IEEE Globecom, 2016*

# Rule Placement for Software Defined IoT

- **Existing rule placement schemes for wired network can be used**
- **Load Balancing to be considered due to the dynamic nature of IoT network**
- **Dynamic resource allocation can be integrated**

# Anomaly Detection in IoT Network

- **Monitor the network through Open Flow to detect any anomaly in the network**
  - Done by monitoring each flow in the network
  - Collect port statistics of the network
  - Generation of large number of packets in the network indicates anomaly
