File-System Interface

Objectives:

- To explain the function of file systems
- To describe the interfaces to file systems
- To discuss file-system design tradeoffs, including access methods, file sharing, file locking, and directory structures
- To explore file-system protection

File operations

```
#include <sys/stat.h>
#include <fcntl.h>
#include <unistd.h>
void main(int argc, char *argp[], char *envp[])
   int fd, len;
   char buffer[100], *path = "file";
   /* Open a file and write some contents. If file already exists,
   delete old contents */
  fd = open(path, O_WRONLY | O_CREAT | O_TRUNC, 0660);
  write(fd, "hello", strlen("hello"));
  write(fd, " world", strlen(" world"));
   close(fd);
```

```
/* Sequential read */
fd = open(path, O_RDWR);
len = read(fd, buffer, 4);
write(1, buffer, len);
len = read(fd, buffer, 4);
write(1, buffer, len);
close(fd);
/* Direct access */
fd = open(path, O_RDWR);
lseek(fd, 5, SEEK SET);
len = read(fd, buffer, 4);
write(1, buffer, len);
lseek(fd, 500, SEEK_END);
write(fd, "Haha", 4);
close(fd);
```

File Concept

- Contiguous persistent logical address space, can be storing data or programs
- File Structure can be:
 - None sequence of words, bytes
 - Simple record structure
 - Lines
 - Fixed length
 - Variable length
 - Complex Structures
 - Formatted document
 - Relocatable load file
- Can simulate last two with first method by inserting appropriate control characters
- Who decides:
 - Operating system
 - Program

File Types – Name, Extension

file type	usual extension	function	
executable	exe, com, bin or none	ready-to-run machine- language program	
object	obj, o	compiled, machine language, not linked	
source code	c, cc, java, pas, asm, a	source code in various languages	
batch	bat, sh	commands to the command interpreter	
text	txt, doc	textual data, documents	
word processor	wp, tex, rtf, doc	various word-processor formats	
library	lib, a, so, dll	libraries of routines for programmers	
print or view	ps, pdf, jpg	ASCII or binary file in a format for printing or viewing	
archive	arc, zip, tar	related files grouped into one file, sometimes com- pressed, for archiving or storage	
multimedia	mpeg, mov, rm, mp3, avi	binary file containing audio or A/V information	

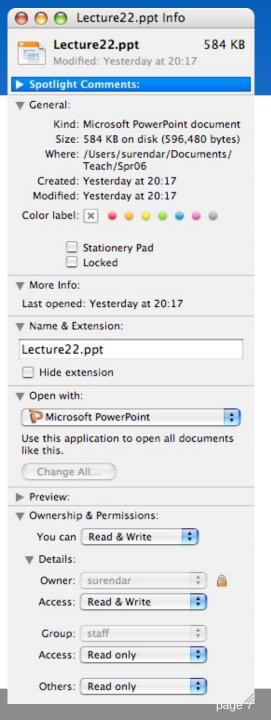

File Attributes

- Name only information kept in human-readable form
- Identifier unique tag (number) identifies file within file system
- Type needed for systems that support different types
- Location pointer to file location on device
- Size current file size
- Protection controls who can do reading, writing, executing
- Time, date, and user identification data for protection, security, and usage monitoring
- Information about files are kept in the directory structure, which is maintained on the disk

Examples

UNIX: Is -li
 26047823 -rw-r--r-- 1 surendar staff
 596480 Mar 16 20:17 Lecture22.ppt

File Operations

- File is an **abstract data type**
- File operations:
 - Create
 - Write
 - Read
 - Reposition within file (seek)
 - Delete
 - Truncate
- $Open(F_i)$ search the directory structure on disk for entry F_i , and move the content of entry to memory
- Close (F_i) move the content of entry F_i in memory to directory structure on disk

Open Files

- Several pieces of data are needed to manage open files:
 - File pointer: pointer to last read/write location, per process that has the file open
 - File-open count: counter of number of times a file is open
 to allow removal of data from open-file table when last processes closes it
 - Disk location of the file: cache of data access information
 - Access rights: per-process access mode information

Open File Locking

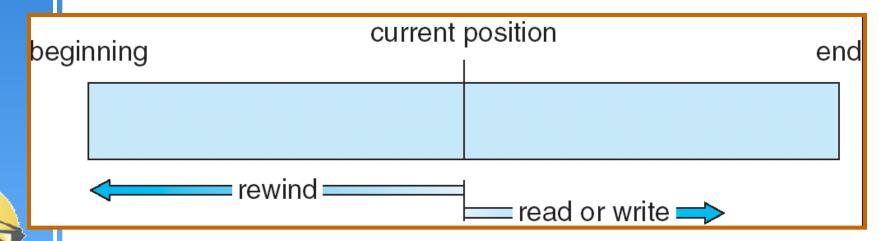

- Provided by some operating systems and file systems
- Mediates access to a file
- Mandatory or advisory:
 - Mandatory access is denied depending on locks held and requested
 - Advisory processes can find status of locks and decide what to do

Access Methods

- Sequential Access
- Direct Access

Sequential-access File

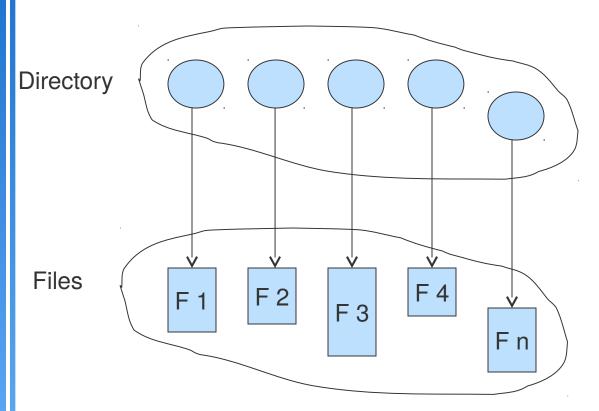

Simulation of Sequential Access on a Direct-access File

sequential access	implementation for direct access	
reset	cp = 0;	
read next	read cp; $cp = cp + 1$;	
write next	write cp ; $cp = cp + 1$;	

Directory Structure

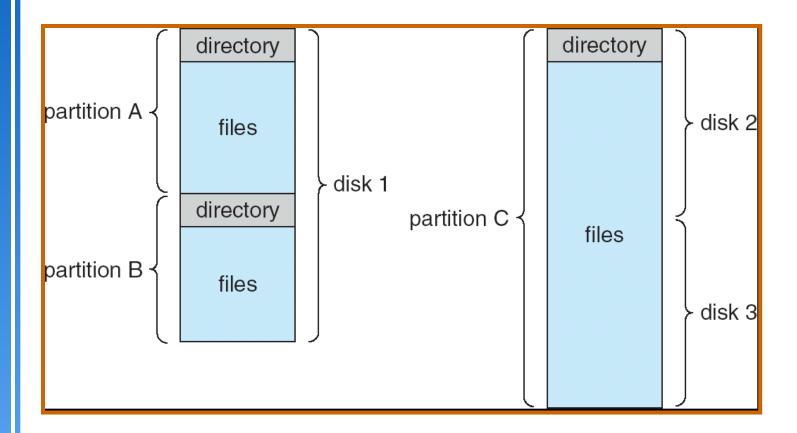

A collection of nodes containing information about all files

Both the directory structure and the files reside on disk Backups of these two structures are kept on tapes

A Typical File-system Organization

Operations Performed on Directory

- Search for a file
- Create a file
- Delete a file
- List a directory
- Rename a file
- Traverse the file system

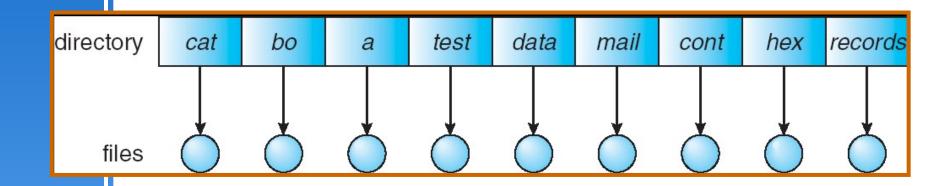

Organize the Directory (Logically) to Obtain

- Efficiency locating a file quickly
- Naming convenient to users
 - Two users can have same name for different files
 - The same file can have several different names
- Grouping logical grouping of files by properties, (e.g., all Java programs, all games, …)

Single-Level Directory

A single directory for all users

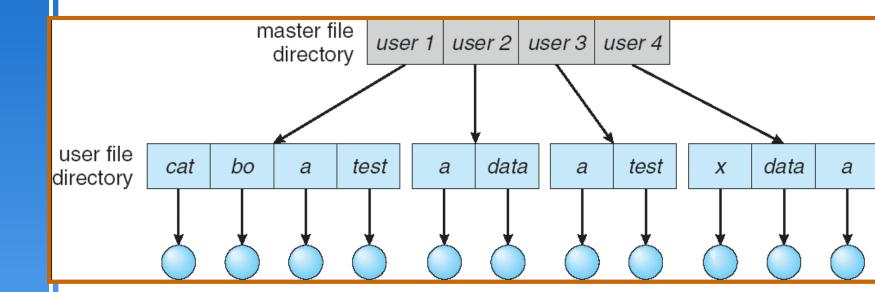

Naming problem

Grouping problem

Two-Level Directory

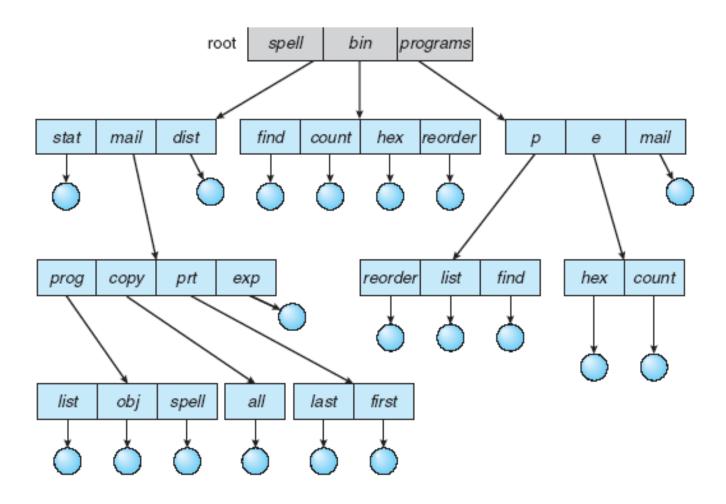

Separate directory for each user

- Path name
- Can have the same file name for different user
- Efficient searching
- No grouping capability

Tree-Structured Directories

Tree-Structured Directories (Cont)

- Efficient searching
- Grouping Capability
- Current directory (working directory)
 - cd /spell/mail/prog
 - type list

Tree-Structured Directories (Cont)

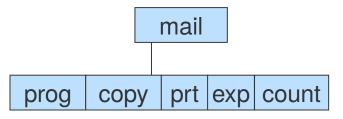

- ▶ Absolute or relative path name
- Creating a new file is done in current directory
- Delete a file

```
rm <file-name>
```

Creating a new subdirectory is done in current directory

```
mkdir <dir-name>
```

Example: if in current directory /mail mkdir count

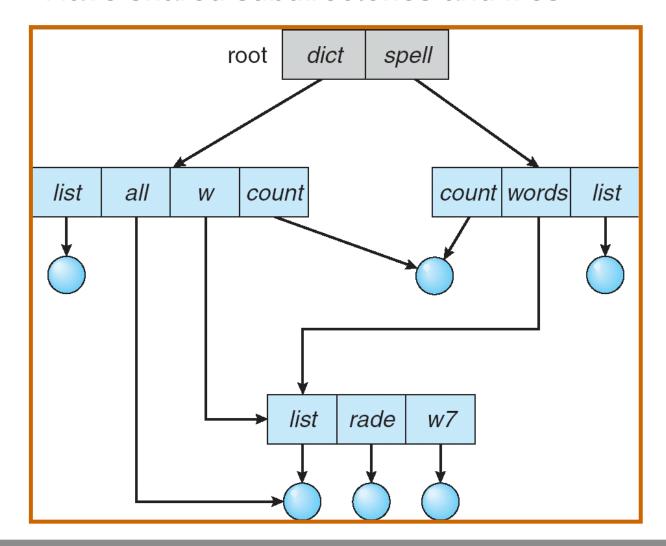

Deleting "mail" ⇒ deleting the entire subtree rooted by "mail"

Acyclic-Graph Directories

Have shared subdirectories and files

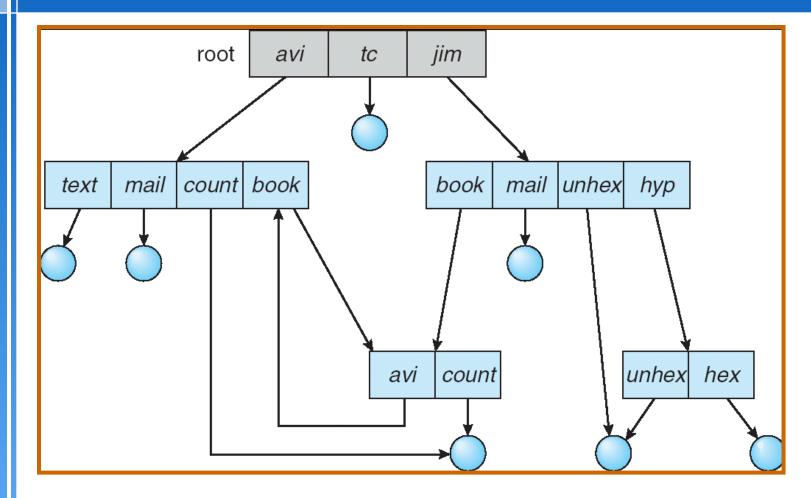

Acyclic-Graph Directories (Cont.)

- Two different names (aliasing)
- If dict deletes list ⇒ dangling pointer Solutions:
 - Backpointers, so we can delete all pointers
 Variable size records a problem
 - Backpointers using a daisy chain organization
 - Entry-hold-count solution
- New directory entry type
 - Link another name (pointer) to an existing file
 - **Resolve the link** follow pointer to locate the file

General Graph Directory

General Graph Directory (Cont.)

- How do we guarantee no cycles?
 - Allow only links to file not subdirectories
 - Garbage collection
 - Every time a new link is added use a cycle detection algorithm to determine whether it is OK

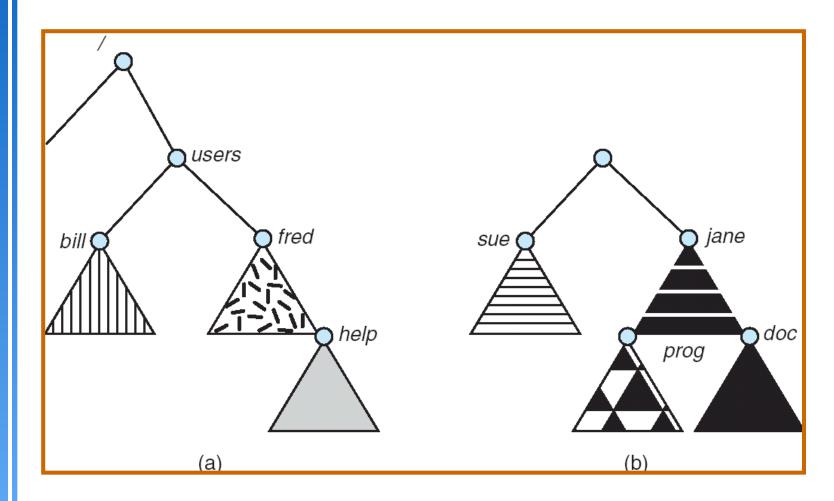

File System Mounting

- A file system must be mounted before it can be accessed
- A unmounted file system (i.e. Fig. 11-11(b)) is mounted at a mount point

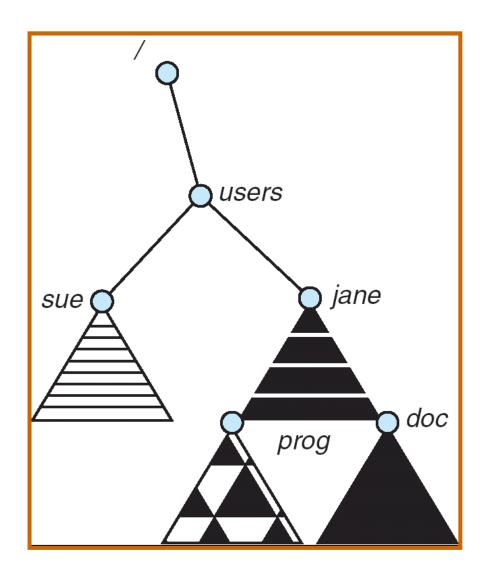

(a) Existing. (b) Unmounted Partition

Mount Point

File Sharing

- Sharing of files on multi-user systems is desirable
- Sharing may be done through a protection scheme
- On distributed systems, files may be shared across a network
- Network File System (NFS) is a common distributed file-sharing method

File Sharing – Multiple Users

- User IDs identify users, allowing permissions and protections to be per-user
- Group IDs allow users to be in groups, permitting group access rights

File Sharing – Consistency Semantics

- Consistency semantics specify how multiple users are to access a shared file simultaneously
 - Similar to Ch 7 process synchronization algorithms
 - Tend to be less complex due to disk I/O and network latency (for remote file systems
 - Andrew File System (AFS) implemented complex remote file sharing semantics
 - Unix file system (UFS) implements:
 - Writes to an open file visible immediately to other users of the same open file
 - Sharing file pointer to allow multiple users to read and write concurrently
 - AFS has session semantics
 - Writes only visible to sessions starting after the file is closed

Protection

- File owner/creator should be able to control:
 - what can be done
 - by whom
- Types of access
 - Read
 - Write
 - Execute
 - Append
 - Delete
 - List

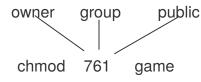

Access Lists and Groups

- Mode of access: read, write, execute
- Three classes of users

		RWX
7	\Rightarrow	111
		RWX
6	\Rightarrow	110
		RWX
1	\Rightarrow	001
	7 6 1	6 ⇒

- Ask manager to create a group (unique name), say G, and add some users to the group.
- For a particular file (say *game*) or subdirectory, define an appropriate access.

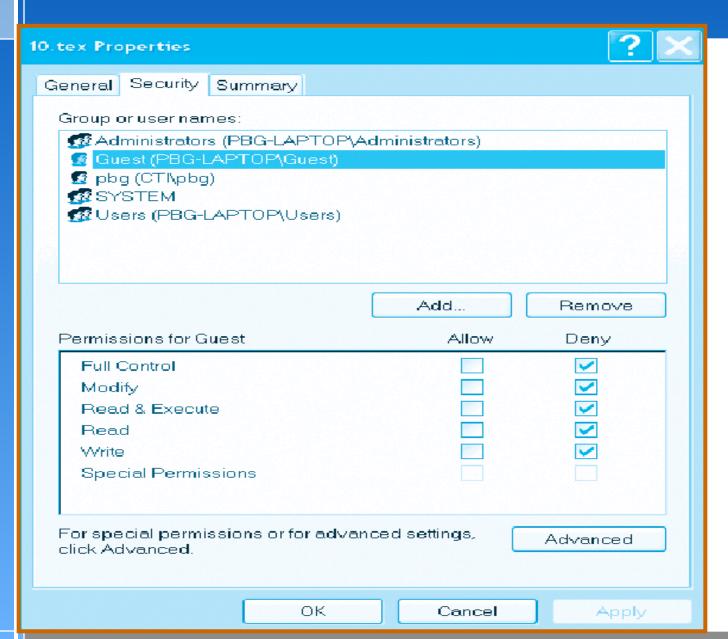

Attach a group to a file

chgrp G game

Vindows XP Access-control List Management

A Sample UNIX Directory Listing
